BAR-AUTOSPC-CHECK

BAR-AUTOSPC-CHECK: 1-CBAR with end load. Skew coord. system and test of AUTOSPC (9/23/03)

$I1 = I2 = 0.1$

$A = 0$, $J = 0$

$\ell = 10$

$E = 10^7$

Ans. for Global coord sys is basic at G.P. 102

The displ and rotation at the end are

ans. in basic coord system

$$v_0 = \frac{P\ell^3}{3EI_1} = \frac{(100)(10^3)}{3(10^7)(0.1)} = 3.333333\times10^{-2} \text{ in } Y_0 \text{ direction}$$

$$\theta_{z_0} = \frac{P\ell^2}{EI} = \frac{(100)(10^2)}{2(10^7)(0.1)} = 5.000000\times10^{-3} \text{ about } z_0 \text{ axis}$$

BAR-AUTOSPC-CHECK: global coord sys is #25 - skewed at 53.1° angle to X_0 axis (3-4-5 triangle)

Since A, J = 0, MYSTRAN AUTOSPC's components 2 and 5 at G.P. 102 in coord sys 25 (since Y_{25} is closer to X_0 axis than X_{25} is). Based on this and the v_0, θ_{z_0} above:

$$u_{25} = \left(\frac{5}{4}\right)v_0 = \frac{5}{4}\left(3.333333\times10^{-2}\right) = 4.166667\times10^{-2}$$

$$\theta_{z_{25}} = \theta_{z_0} = 5.000000\times10^{-3} \text{ (since } z_{25} \parallel z_0\text{)}$$

MYSTRAN gets these answers.

BAR-GRAV

<u>BAR-GRAV</u> : BAR Model with gravity loading (check on applied load calc)

CBAR 12-56: $\begin{cases} L = 2 \\ A = .4 \\ I_1 = 2. \\ I_2 = 3 \\ E = 1\times10^7,\ \gamma = 0.1 \end{cases}$

W_6 = 5 lb CONM2 here

offset $\left.\begin{array}{l} d_x = .2 \\ d_y = .3 \\ d_z = .4 \end{array}\right\}$ basic

Each CBAR weigh $AL\gamma = (.4)(2)(.1) = .08$ with ½ going to each CBAR grid.

The 5 lb CONM2 has a grid mass matrix (also incl CBAR 56 weight) of:

$$W_{66} = \begin{bmatrix} W_6 + \frac{AL\gamma}{2} & 0 & 0 & 0 & W_6 d_z & -W_6 d_y \\ 0 & W_6 + \frac{AL\gamma}{2} & 0 & -W_6 d_z & 0 & W d_x \\ 0 & 0 & W_6 + \frac{AL\gamma}{2} & W_6 d_y & -W d_x & 0 \\ & & & W_6(d_y^2 + d_z^2) & -W_6 d_x d_y & -W_6 d_x d_z \\ & \text{Sym} & & & W_6(d_x^2 + d_z^2) & -W_6 d_y d_z \\ & & & \text{Sym} & & W_6(d_x^2 + d_y^2) \end{bmatrix}, \quad \begin{array}{l} W_6 = 5 \\ d_x = .2 \\ d_y = .3 \\ d_z = .4 \end{array} \qquad (1)$$

$$W_6 + \frac{AL\gamma}{2} = 5.04 \qquad (2)$$

The grav forces at grid 106 are W_{66} times the grav accel. vector. Since global is basic and the grav load is specified in coord sys 9:

Accel at all grids is;

$$a_g = \begin{Bmatrix} 4.5 \\ 6.0 \\ 3.0 \\ 0 \\ 0 \\ 0 \end{Bmatrix}_{\text{basic/global}} \qquad (3)$$

The grav forces at 106 are W_{66} times a_g which is P_{106}

$$P_{106} = \left[\begin{array}{c|c|c|c|c|c} 5.04 & 0 & 0 & 0 & 2.0 & -1.5 \\ 0 & 5.04 & 0 & -2.0 & 0 & 1.0 \\ 0 & 0 & 5.04 & 1.5 & -1.0 & 0 \\ \hline 0 & -2.0 & 1.5 & 1.25 & -0.30 & -0.40 \\ 2.0 & 0 & -1.0 & -0.30 & 1.00 & -0.60 \\ -1.5 & 1.0 & 0 & -0.40 & -0.60 & 0.65 \end{array}\right] \begin{Bmatrix} 4.5 \\ 6.0 \\ 3.0 \\ 0 \\ 0 \\ 0 \end{Bmatrix} = \begin{Bmatrix} 22.68 \\ 30.24 \\ 15.12 \\ -7.50 \\ 6.00 \\ -0.75 \end{Bmatrix} \qquad (4)$$

The remainder of the grids have only the bar weight at the grid times a_g

Grid 101 has .04 lb weight and 102-105 have .08 lb so

$$P_{101} = .04 \begin{bmatrix} 4.5 \\ 6.0 \\ 3.0 \\ 0 \\ 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 0.18 \\ 0.24 \\ 0.12 \\ 0 \\ 0 \\ 0 \end{bmatrix} \quad \text{and} \quad P_{102} = P_{103} = P_{104} = P_{105} = .08 \begin{bmatrix} 4.5 \\ 6.0 \\ 3.0 \\ 0 \\ 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 0.36 \\ 0.48 \\ 0.24 \\ 0 \\ 0 \\ 0 \end{bmatrix} \qquad (5)$$

This results in the applied load matrix for all grids (eqn (4), (5)):

Applied Loads

Grid	CID	T1	T2	T3	R1	R2	R3
101	0	0.18	0.24	0.12	0	0	0
102	0	0.36	0.48	0.24	0	0	0
103	0	"	"	"	0	0	0
104	0	"	"	"	0	0	0
105	0	"	"	"	0	0	0
106	0	22.68	30.24	15.12	-7.50	6.00	-0.75

BAR-I12

BAR-I12: 1 CBAR, 2 Grid model. Bar has nonzero I12

Fig 1

$$\text{CBAR 11}: \begin{cases} L = 10 \\ I_1 = 5. \\ I_2 = 4 \\ I_{12} = 2 \\ E = 10^7 \end{cases} \qquad (1)$$

$$Ku = P \quad ,$$

where

$$u = \begin{bmatrix} v \\ w \\ \theta_y \\ \theta_z \end{bmatrix}, \quad P = \begin{bmatrix} F_y \\ F_z \\ M_y \\ M_z \end{bmatrix} = \begin{bmatrix} 6 \\ -12 \\ 6 \\ 9 \end{bmatrix} \qquad (2)$$

$$K = \begin{bmatrix} R_1 & \beta & \frac{l}{2}\beta & -\frac{l}{2}R_1 \\ \beta & R_2 & \frac{l}{2}R_2 & -\frac{l}{2}\beta \\ \frac{l}{2}\beta & \frac{l}{2}R_2 & \hat{k}_2 & -\frac{l^2}{3}\beta \\ -\frac{l}{2}R_1 & -\frac{l}{2}\beta & -\frac{l^2}{2}\beta & \hat{k}_1 \end{bmatrix} \qquad (3)$$

$$\left.\begin{aligned} R_1 &= \frac{12EI_1}{L^3} = \frac{(12)(10^7)}{1000}\cdot E_1 = 1.2\times10^5 I_1 = 6\times10^5 \\ R_2 &= \frac{12EI_2}{L^3} = 1.2\times10^5 I_2 = 4.8\times10^5 \\ \beta &= \frac{12EI_{12}}{L^3} = 1.2\times10^5 I_{12} = 2.4\times10^5 \end{aligned}\right\}$$

$$\left.\begin{aligned} \hat{k}_1 &= \frac{L^2}{4}R_1 + \frac{EI_1}{L} = \frac{100}{4}(6\times10^5) + \frac{(10^7)(5)}{10} = 1.5\times10^7 + .5\times10^7 = 2.0\times10^7 \\ \hat{k}_2 &= \frac{L^2}{4}R_2 + \frac{EI_2}{L} = \frac{100}{4}(4.8\times10^5) + \frac{(10^7)(4)}{10} = 1.2\times10^7 + .4\times10^7 = 1.6\times10^7 \end{aligned}\right\} \qquad (4)$$

Subst (4) into (3)

$$10^4 \begin{bmatrix} 60 & 24 & 120 & -300 \\ 24 & 48 & 240 & -120 \\ 120 & 240 & 1600 & -800 \\ -300 & -120 & -800 & 2000 \end{bmatrix} \begin{bmatrix} v \\ w \\ \theta_y \\ \theta_z \end{bmatrix} = \begin{bmatrix} 6 \\ -12 \\ 6 \\ 9 \end{bmatrix} \begin{matrix} R_{11} \\ R_{21} \\ R_{31} \\ R_{41} \end{matrix} \qquad (5)$$

Solve by Gaussian elimination.

$$\begin{matrix} \\ 0.4\,R_{11} - R_{21} \longrightarrow \\ 2\,R_{11} - R_{31} \longrightarrow \\ 5\,R_{11} + R_{41} \longrightarrow \end{matrix} \quad 10^4 \begin{bmatrix} 60 & 24 & 120 & -300 \\ 0 & -38.4 & -192 & 0 \\ 0 & -192 & -1360 & 200 \\ 0 & 0 & -200 & 500 \end{bmatrix} \begin{bmatrix} v \\ w \\ \theta_y \\ \theta_z \end{bmatrix} = \begin{bmatrix} 6 \\ 14.4 \\ 6 \\ 39 \end{bmatrix} \begin{matrix} R_{12} \\ R_{22} \\ R_{32} \\ R_{42} \end{matrix}$$

$$\begin{matrix} \\ \\ 5\,R_{22} - R_{23} \\ \\ \end{matrix} \quad 10^4 \begin{bmatrix} 60 & 24 & 120 & -300 \\ 0 & -38.4 & -192 & 0 \\ 0 & 0 & 400 & -200 \\ 0 & 0 & -200 & 500 \end{bmatrix} \begin{bmatrix} v \\ w \\ \theta_y \\ \theta_z \end{bmatrix} = \begin{bmatrix} 6 \\ 14.4 \\ 66 \\ 39 \end{bmatrix} \begin{matrix} R_{13} \\ R_{23} \\ R_{33} \\ R_{43} \end{matrix}$$

$$\begin{matrix} \\ \\ \\ R_{33} + 2R_{34} \end{matrix} \quad 10^4 \begin{bmatrix} 60 & 24 & 120 & -300 \\ 0 & -38.4 & -192 & 0 \\ 0 & 0 & 400 & -200 \\ 0 & 0 & 0 & 800 \end{bmatrix} \begin{bmatrix} v \\ w \\ \theta_y \\ \theta_z \end{bmatrix} = \begin{bmatrix} 6 \\ 14.4 \\ 66 \\ 144 \end{bmatrix} \qquad (6)$$

Solve (1) by back substitution:

from 4th row

$$800\,\theta_z = 144\times10^{-4}$$

$$\therefore\ \theta_z = 1.8\times10^{-5} \qquad (7)$$

Subst (7) into 3rd row of (1)

$$400\,\theta_y - 700\left(1.8\times10^{-5}\right) = 66\times10^{-4}$$

$$\theta_y = \frac{1}{400}\left[66+36\right]\times10^{-4} = 2.55\times10^{-5} \qquad (8)$$

Subst (7), (8) into 2nd row of (1)

$$-38.4\,w - 192\left(2.55\times10^{-5}\right) = 14.4\times10^{-4}$$

$$w = \frac{-1}{38.4}\left[14.4+192(.255)\right]10^{-4} = -1.65\times10^{-4} \qquad (9)$$

Subst (7)-(9) into 1st row of (1):

$$60v + 24\left(1.65\times10^{-4}\right) + 120\left(.255\times10^{-4}\right) - 300\left(1.8\times10^{-4}\right) = 6\times10^{-4}$$

$$v = \frac{1}{6}\left[6 - 24(-1.65) - 120(.255) + 300(.18)\right]10^{-4}$$

$$v = \frac{1}{6}\left(6+39.6-30.6+54\right)10^{-4} = \frac{69}{6}\times10^{-4} = 1.15\times10^{-4}$$

Displacements

At G.P. 102

$$\begin{Bmatrix} P_x \\ P_y \\ P_z \\ M_x \\ M_y \\ M_z \end{Bmatrix}_{\substack{Grid \\ 102}} = \begin{bmatrix} 1 & & & & & \\ & 1 & & & & \\ & & 1 & & & \\ & & -2 & 1 & & \\ & & & & 1 & \\ -2 & & & & & 1 \end{bmatrix} \begin{Bmatrix} 200 \\ 300 \\ 600 \\ -1200 \\ 0 \\ 400 \end{Bmatrix} = \begin{Bmatrix} 200 \\ 300 \\ 600 \\ 0 \\ 0 \\ 0 \end{Bmatrix}_{\substack{Grid \\ 102}}$$

BAR-PINFLAG

BAR-PINFLAG

CBAR 12-45: $\begin{cases} A = 0.1 \\ I_1 = 0.01 \\ I_2 = 0.02 \\ J = 0.03 \\ L = 1'' \end{cases}$

CBAR 34 pinflag releases DOF 2-6 from grid 103

Applied loads

$$P_{X_{103}} = 200$$
$$P_{Y_{103}} = 300$$
$$P_{Z_{103}} = 600$$

Since CBAR 34 is only connected to grid 103 in DOF 1 then this can be viewed as one problem for axial and another for bending

for axial:

$$k_a = \text{axial stiffness} = \frac{1}{\frac{1}{k_{12}} + \frac{1}{k_{23}}} + \frac{1}{\frac{1}{k_{34}} + \frac{1}{k_{35}}} \quad \text{for grid 103}$$

where $k_{ij} = \frac{AE}{L}$

$$= \frac{(0.1)(10^7)}{1} = 10^6$$

so $$k_a = \frac{1}{2/10^6} + \frac{1}{2/10^6} = 10^6$$

$$u_{103} = \frac{P_{X_{103}}}{k_a} = \frac{200}{10^6} = 2\times10^{-4} \quad \text{and} \quad \therefore u_{102} = u_{104} = \frac{1}{2}u_{103} = 1\times10^{-4}$$

Axial loads in elems: CBAR 12,23 : 100# tension $\left\{ \begin{array}{l} \text{½ of appl load goes to 12,23 other} \\ \text{½ goes to 34,45 due to parallel springs} \end{array} \right.$

CBAR 34,45 : 100# compr.

BAR-THERM-CONSTR

BAR-THERM-CONSTR: 2 CBAR, 3 GRID model constr at both ends w/ thermal loads
Not stress-free expansion.

CBAR 12, 23
$L = 5.$
$A = 0.4$
$I_1 = 4.$
$I_2 = 5.$
$E = 1\times10^7,\ \alpha = 20\times10^{-6},\ T_{ref} = 21.$

Subcase 21 is a thermal load consisting of:

a) Linear temp dist along length ($\Delta T = 0$ at G.P. 101, to $\Delta T = 4$ at G.P. 103

b) $+2°$ Gradient through Y_e depth of CBARS 12, 23

c) $-4°$ " " Z_e " " " " "

Y_e, Z_e are local elem axes where $Y_e = Y_0$, $Z_e = Z_0$

We need to determine equivalent thermal loads for the temp. distribution.

For an element

For a + gradient on a cant. beam (see BAR-THERM-FREE) the rotation at end is

$$\theta = \pm \alpha T' L \qquad (1)$$

For a moment on a cant. beam

$$\theta = \pm \frac{M_T L}{EI} \qquad (2)$$

Equating the 2 we get

$$M_T = \pm EI\alpha T' \qquad EI_1\alpha LT' = (1\times10^7)(4)(20\times10^{-6})T' = 800\,T'$$
$$EI_2\alpha LT' = (1\times10^7)(5)(20\times10^{-6})T' = 1000\,T' \qquad (3)$$

also, for a bulk temp change ΔT the axial displ of one end rel. to the other is

$$\Delta = \alpha L \Delta T \qquad (4)$$

and the displ for a load P_T is

$$\Delta = \frac{P_T L}{AE} \qquad (5)$$

equating the 2

$$P_T = AE\alpha\Delta T \qquad AE\alpha = \Delta T = (.4)(1\times10^7)(6.0\times10^{-6})\Delta T = 80.\ \Delta T \qquad (6)$$

from (6), calc equiv thermal loads due to $\Delta T = 1°$ for elem 12 (avg of G.P.'s 101, 102 = 0, 2°)

and $\Delta T = 3°$ for elem 23 (avg of G.P.'s 102, 103 = 2° and 4°)

Applied Equiv. Thermal Loads

<u>Axial Loads Due To ΔT</u>

Fig 3

From (6): $P_{T_{12}} = 80.$ From (6): $P_{T_{23}} = 240.$

Combining these on the assembled beam we get

Fig 4

$$\therefore w_{87_{102}} = \frac{P_{T_{12}} - P_{T_{23}}}{k_{12} + k_{23}} = -\frac{160.}{16\times10^5} = -1\times10^{-4} \qquad (7)$$

and applied load (therm equivalent)

$$P_q = \begin{Bmatrix} P_{101} \\ P_{102} \\ P_{103} \end{Bmatrix} = \begin{Bmatrix} -80. \\ -160. \\ 240. \end{Bmatrix} \begin{matrix} \text{in } z_{87} \\ '' \\ '' \end{matrix} \qquad (8)$$

Applied Equiv. Thermal loads, con't

Moments About y_{87} Due To $T'_{y_e} = 2°/in$

Fig 5

From (3) $M_{T_{12}} = 800 \cdot T' = 1600$ From (3) $M_{T_{23}} = 800\,T' = 1600$ (8)

Combining these on the assembled beam we get

Fig 6

As a result of this there is no net load on G.P. 102 due to the 2° grad T'_{y_e} so:

$$u_{87_{102}} = \theta_{y_{87_{102}}} = 0, \quad P_g = \begin{cases} +1600 & \text{G.P. 101 } \theta_{y_{87}} \\ 0 & \text{G.P. 102 } \theta_{y_{87}} \\ -1600 & \text{G.P. 103 } \theta_{y_{87}} \end{cases} \quad (9)$$

Moments About x_{87} Due To $T'_{z_e} = -4°/in$

Fig 7

From (3): $M_{T_{12}} = 1000T' = -4000$ From (3) $M_{T_{23}} = 1000T' = -4000$

Combining on assembled model

Fig 8

Again, no net load so

$$v_{87_{102}} = \theta_{x_{87_{102}}} = 0 \quad \text{and applied load (equiv thermal): } P_g = \begin{cases} 4000 & \text{G.P. 101 about } \theta_{x_{87}} \\ 0 & \text{G.P. 102 " "} \\ -4000 & \text{G.P. 103 " "} \end{cases} \quad (10)$$

from (7), (9), (10)

Displacements

Grid	CID	T1	T2	T3	R1	R2	R3
101	87	0	0	0	0	0	0
102	87	0	0	-1×10^{-4}	0	0	0
103	87	0	0	0	0	0	0

Applied Loads (Equiv. Thermal)

Grid	CID	T1	T2	T3	R1	R2	R3
101	87	0	0	-80.	4000	1600	0
102	87	0	0	-160.	0	0	0
103	87	0	0	240.	-4000	-1600	0

There are SPC forces. SPC Moments at 101, 103 are opposite sign to the equiv. thermal moments on prev. page (to force G.P. equil of the appl + SPC moments since that is all that is applied there). There is an axial SPC force which is most easily calc'd by letting the beam expand freely in z_{87} and then calc load to put ends at 0 displ. The free expansion of whole beam is $\Delta = \alpha(2L)\Delta T_{avg} = (20\times10^{-6})(10)(2^\circ) = 4\times10^{-4}$. To put this back to zero, need compr. force of $P = k\Delta = \left(\frac{8\times10^{6}}{2}\right)(4\times10^{-4}) = 1600$ lb (NOTE: overall k of beam is the 2 CBARS in series $= 8\times10^{6}/2$ and $\Delta T_{avg} = \frac{\Delta T_{103} - \Delta T_{101}}{2} = \frac{4-0}{2} = 2$

SPC forces

Grid	CID	T1	T2	T3	R1	R2	R3
101	87	0	0	160.	-4000	-1600	0
102	87	0	0	0	0	0	0
103	87	0	0	-160.	4000	1600	0

Element Engineering Forces

Element engineering forces are easily deduced logically and with aid of the applied equiv. thermal load, SPC forces

From the T3 SPC force it is seen that the whole beam is in 1600 lb compression

$$\text{Engr Axial Force CBAR 12, 23} = -160$$

$$\therefore \sigma_{axial} = -160./A = -400\,psi \qquad (11)$$

From fig 5 it is seen that the 1600 in lb moments (appl. equiv thermal) were put on CBARS 12, 23 as an equiv load to produce free thermal expansion due to the $T' = 2$ in y_e (x_{87}) direction. Since the overall displ's and rotations due to the $T' = 2$ were zero ($u_{87_{1,2}}, \theta_{y_{87_{1,2}}} = 0$) then a 1600 in-lb moment is needed to deflect each BAR back to zero displ & rotation. Therefore the elem engr moments due to the $T' = 2$ in x_{87} are

The fact that the $T' = +2$ means that top is warm (and will expand) and bottom is cool (will contract) and in order to counteract this we need a positive moment, as shown.

BAR-THERM-FREE

BAR-THERM-FREE : 2 CBAR, 3 GRID model constr on one end w/ thermal loads
Stress-free expansion. Uses coord 87 for global

CBAR 12, 13 $\begin{cases} L = 5 \\ A = .4 \\ I_1 = 4. \\ I_2 = 5. \\ E = 1\times10^7,\ \alpha = 20\times10^{-6},\ T_{ref} = 21 \end{cases}$

Subcase 21 is a thermal load consisting of

a) Linear temp distr. along length ($\Delta T = 0$ at G.P. 101 to $\Delta T = 4$ at G.P. 103)

b) $+2^\circ$ Gradient through Y_e depth of CBARS 12, 23 } Y_e, Z_e are local

c) -4° " " Z_e depth " " " " } elem axes where $Y_e = Y_0$, $Z_e = Z_0$

a) Linear temp gradient

$\Delta T_{101} = 0$

$\Delta T_{102} = 2^\circ$ } CBAR 12 has avg ΔT_{12} of 1°

$\Delta T_{103} = 4^\circ$ } CBAR 23 " " ΔT_{23} " 3°

$$w_{102_{87}} = \alpha L \Delta T_{12} = (20\times10^{-6})(5)(1) = 1\times10^{-4}$$

$$w_{103_{87}} = w_{102_{87}} + \alpha L \Delta T_{23} = 1\times10^{-4} + (20\times10^{-6})(5)(3) = 4\times10^{-4}$$

For free expansion due to gradient:

The gradient is

$$T' = \frac{T_T - T_B}{d}$$

The displ along the top and bottom are

$$u_T = \alpha T_T z_{87}, \quad u_B = \alpha T_B z_{87}$$

The bending rotation due to the differential displ bet top/bottom is:

$$\theta = \pm \frac{u_T - u_B}{d} = \pm \alpha \left(\frac{T_T - T_B}{d}\right) z_{87} = \pm \alpha T' z_{87}$$

The lateral displ is

$$\Delta = \pm \int \theta \, dz_{87} = \pm \alpha T' \frac{z_{87}^2}{2}$$

The $\pm$ depends on the convention for + rotation for + T'. For example, a pos T' through y_e causes a neg rotation about y_{87} while a pos gradient through z_e causes a pos rotation about x_{87} so that

<u>2° Grad in y_e</u>: $\quad u_{87_{101}} = 0, \quad \theta_{y_{87_{101}}} = 0$

$$u_{87_{102}} = -\alpha T' \left(\frac{5^2}{2}\right) = -(20\times10^{-6})(2)(12.5) = -5\times10^{-4} \text{ in}$$

$$\theta_{y_{87_{102}}} = -\alpha T'(5) = -(20\times10^{-6})(2)(5) = -2\times10^{-4} \text{ rad}$$

$$u_{87_{103}} = -\alpha T'\left(\frac{10^2}{2}\right) = -2\times10^{-3} \text{ in}$$

$$\theta_{y_{87_{103}}} = -\alpha T'(10) = -4\times10^{-4} \text{ rad}$$

<u>-4° Grad in z_e</u>

$$v_{87_{101}} = 0 \quad , \quad \theta_{x_{87_{101}}} = 0$$

$$v_{87_{102}} = -\alpha T' \frac{z_{87}^2}{2} = -(20\times10^{-6})(-4)\left(\frac{5^2}{2}\right) = 1\times10^{-3} \text{ in}$$

$$\theta_{x_{87_{102}}} = \alpha T' z_{87} = (20\times10^{-6})(-4)(5) = -4\times10^{-4} \text{ rad}$$

$$v_{87_{103}} = -\alpha T' \frac{z_{87}^2}{2} = -(20\times10^{-6})(-4)\left(\frac{10^2}{2}\right) = 4\times10^{-3} \text{ in}$$

$$\theta_{x_{87_{103}}} = \alpha T' z_{87} = (20\times10^{-6})(-4)(10) = -8\times10^{-2} \text{ rad}$$

CONM2-A

CONM2A.DAT

Global coord system is #29 at G.P. 101, 201

CONM2's are defined in system #18

At G.P. 101 CONM2 11 has $m_{101} = 100^{\#}$, $d_{18}^{101} = \begin{Bmatrix} 0 \\ 0 \\ 2 \end{Bmatrix}$, $I_{18,18}^{101} = \begin{bmatrix} 105. & & \text{sym} \\ 110. & 111. & \\ 115. & 116. & 116. \end{bmatrix}$

At G.P. 201 CONM2 21 has $m_{201} = 300^{\#}$, $d_{18}^{201} = \begin{Bmatrix} 0 \\ 0 \\ 4 \end{Bmatrix}$, $I_{18,18}^{201} = \begin{bmatrix} 206. & & \text{sym} \\ 211. & 211. & \\ 216. & 216. & 217. \end{bmatrix}$

Transformation Matrices

$$\begin{Bmatrix} u \\ v \\ w \end{Bmatrix}_0 = \underbrace{\begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & -1 & 0 \end{bmatrix}}_{T_{0,18}} \begin{Bmatrix} u \\ v \\ w \end{Bmatrix}_{18}$$

$$\begin{Bmatrix} u \\ v \\ w \end{Bmatrix}_0 = \underbrace{\begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 0 & 0 \end{bmatrix}}_{T_{0,29}} \begin{Bmatrix} u \\ v \\ w \end{Bmatrix}_{29}$$

Transform CONM2 Values From Coord #18 To Basic (At the Mass)

$$d_0^{101} = T_{0,18}\, d_{18}^{101} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & -1 & 0 \end{bmatrix} \begin{Bmatrix} 0 \\ 0 \\ 2 \end{Bmatrix} = \begin{Bmatrix} 0 \\ 2 \\ 0 \end{Bmatrix}$$

$$d_0^{201} = T_{0,18}\, d_{18}^{201} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & -1 & 0 \end{bmatrix} \begin{Bmatrix} 0 \\ 0 \\ 4 \end{Bmatrix} = \begin{Bmatrix} 0 \\ 4 \\ 0 \end{Bmatrix}$$

$$I_{0,0}^{101} = T_{0,18}\, I_{18,18}^{101}\, T_{0,18}^{T} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & -1 & 0 \end{bmatrix} \begin{bmatrix} 105. & 110. & 115. \\ 110. & 111. & 116. \\ 115. & 116. & 116. \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & -1 \\ 0 & 1 & 0 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & -1 & 0 \end{bmatrix} \begin{bmatrix} 105 & 115 & -110 \\ 110 & 116. & -111 \\ 115 & 116. & -116 \end{bmatrix} = \begin{bmatrix} 105 & 115 & -110 \\ 115. & 116. & -116. \\ -110 & -116. & 111 \end{bmatrix}$$

$$I_{0,0}^{201} = T_{0,18}\, I_{18,18}^{201}\, T_{0,18}^{T} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & -1 & 0 \end{bmatrix} \begin{bmatrix} 206 & 211. & 216. \\ 211 & 211. & 216 \\ 216 & 216. & 217 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & -1 \\ 0 & 1 & 0 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & -1 & 0 \end{bmatrix} \begin{bmatrix} 206 & 216. & -211 \\ 211 & 216. & -211 \\ 216 & 217 & -216 \end{bmatrix} = \begin{bmatrix} 206 & 216 & -211 \\ 216. & 217 & -216 \\ -211 & -216 & 211 \end{bmatrix}$$

The GPWG Reference Pt. is G.P. 201. Translate I_{00}^{101} to G.P. 201.

1) Mass at GP 101 ($d_x = 20$, $d_y = -2$, $d_z = 0$, $m = 100$)

$$(I_{xx})_{201} = (I'_{xx})_{101} + m(d_y^2 + d_z^2) = 105 + 100(2^2 + 0^2) = 505$$

$$(I_{yy})_{201} = (I'_{yy})_{101} + m(d_x^2 + d_z^2) = 116 + 100(20^2 + 0^2) = 40{,}116$$

$$(I_{zz})_{201} = (I'_{zz})_{101} + m(d_x^2 + d_y^2) = 111 + 100(20^2 + 2^2) = 40{,}511$$

$$(I_{yx})_{201} = (I'_{yx})_{101} - m d_y d_x = 115 - 100(-2)(20) = 4115$$

$$(I_{zx})_{201} = (I'_{zx})_{101} - m d_z d_x = -110 - 100(0)(20) = -110$$

$$\underbrace{(I_{zy})_{201}}_{\substack{\text{MoI's of} \\ \text{G.P 101 mass} \\ \text{translated} \\ \text{to Ref. Pt.} \\ \text{(GP 201)}}} = \underbrace{(I'_{zy})_{201}}_{\substack{\text{MoI's of} \\ \text{GP 101 Mass} \\ \text{from above} \\ I_{0,0}^{101} \text{ matrix}}} - m d_z d_y = -116 - m(0)(-2) = -116$$

2) <u>Mass at GP. 201</u> ($d_x = 0,\ d_y = -4,\ d_z = 0$)

$$(I_{xx})_{201} = (I_{x'x'})_{201} + m(d_y^2 + d_z^2) = 206 + 300(-4^2 + 0^2) = 5006$$

$$(I_{yy})_{201} = (I_{y'y'})_{201} + m(d_x^2 + d_z^2) = 217 + 300(0^2 + 0^2) = 217$$

$$(I_{zz})_{201} = (I_{z'z'})_{201} + m(d_x^2 + d_y^2) = 211 + 300(0^2 + (-4)^2) = 5011$$

$$(I_{yx})_{201} = (I_{y'x'})_{201} - m d_y d_x = 216 - 300(-4)(0) = 216$$

$$(I_{zx})_{201} = (I_{z'x'})_{201} - m d_z d_x = -211 - 300(0)(0) = -211$$

$$(I_{zy})_{201} = (I_{z'y'})_{201} - m d_z d_y = -216 - 300(0)(-4) = -216$$

3) Sum 101+201 to get MOI' about Ref. Pt:

$$(I_{xx})_{201} = 505 + 5006 = 5{,}511$$

$$(I_{yy})_{201} = 40{,}116 + 217 = 40{,}333.$$

$$(I_{zz})_{201} = 40{,}511 + 5{,}011 = 45{,}522$$

$$(I_{yx})_{201} = 4{,}115 + 216 = 4{,}331$$

$$(I_{zx})_{201} = -110 - 211 = -321$$

$$(I_{zy})_{201} = -116 - 216 = -332$$

$$I_{REF\,PT} = \begin{bmatrix} 5511. & 4331. & -321. \\ 4331. & 40333. & -332. \\ -321. & -332. & 45522. \end{bmatrix}$$

also agrees w/ MYSTRAN

Calculate Total Mass & C.G.:

$$M_{Tot} = 100 + 300 = 400 \text{ lb total}$$

$$\bar{x}_{cg} = \frac{(-20)(100)}{100+300} = -5'' \text{ from G.P. 201 in } X_0 \text{ direction} \therefore X_{cg} = -5$$

$$\bar{y}_{cg} = \frac{(2)(100)+(-4)(300)}{100+300} = 3.5'' \text{ from G.P. 201 in } Y_0 \text{ direction} \therefore Y_{CG} = 3.5$$

$$\bar{z}_{cg} = 0 \qquad \underbrace{\therefore Z_{cg} = 0}_{\text{rel. to G.P. 201}}$$

Calculate MoI's about C.G. In Basic Coords

$$\left.\begin{aligned}
(I_{xx})_{REF} &= (I_{xx})_{CG} + M_{Tot}(d_y^2 + d_z^2) \\
(I_{yy})_{REF} &= (I_{yy})_{CG} + M_{Tot}(d_x^2 + d_z^2) \\
(I_{zz})_{REF} &= (I_{zz})_{CG} + M_{Tot}(d_x^2 + d_y^2) \\
(I_{yx})_{REF} &= (I_{yx})_{CG} - M_{Tot}\, d_y d_x \\
(I_{zx})_{REF} &= (I_{zx})_{CG} - M_{Tot}\, d_z d_x \\
(I_{zy})_{REF} &= (I_{zy})_{CG} - M_{Tot}\, d_z d_y
\end{aligned}\right\}$$

$d_x = X_{REF} - X_{CG} = 5$

$d_y = Y_{REF} - Y_{CG} = 0 - 3.5 = -3.5$

$d_z = Z_{REF} - Z_{CG} = 0$

$$\left.\begin{aligned}
\therefore (I_{xx})_{CG} &= 5511 - 400(-3.5^2 + 0^2) = 611 \\
(I_{yy})_{CG} &= 40{,}333 - 400(5^2 + 0^2) = 30{,}333 \\
(I_{zz})_{CG} &= 45{,}522 - 400(5^2 + 3.5^2) = 30{,}622 \\
(I_{yx})_{CG} &= 4{,}331 + 400(-3.5)(5) = -2{,}669 \\
(I_{zx})_{CG} &= -321 + 400(0)(5) = -321 \\
(I_{zy})_{CG} &= -332 + 400(0)(-3.5) = -332
\end{aligned}\right\} \text{agrees w/ MYSTRAN}$$

To get principal MoI's use eigenvalue soln with a model shown below

Then

$$K = \begin{bmatrix} k_{12}+k_{13}+k_{14} & -k_{12} & -k_{31} \\ -k_{12} & k_{12}+k_{23}+k_{24} & -k_{23} \\ -k_{31} & -k_{23} & k_{13}+k_{23}+k_{34} \end{bmatrix}, \quad M = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Use

$$k_{12} = 2669, \quad k_{23} = 332, \quad k_{34} = 29969$$

$$k_{13} = 321, \quad k_{14} = -2379, \quad k_{24} = 27332$$

Then

$$I_{CG} = K = \begin{bmatrix} 621 & -2669 & -321 \\ -2669 & 30333 & -332 \\ -321 & -332 & 30622 \end{bmatrix}$$

(same as I_{CG} on previous page)

The eigenvalues and eigenvectors are shown in the following SOL 3 run (CONM2A-PMOI)
The eigenvalues are the PMOI's and the eigenvectors are <u>rows</u> of the transformation from basic to principal directions

Mass Matrix

G.P. mass matrices in local coords at the mass (based on mass, MoI's input on CONM2 cards):

CONM2 ID

$$M^{11}_{\substack{mass,11\\ local=18}} = \left[\begin{array}{ccc|ccc} 100 & & & & & \\ & 100 & & & & \\ & & 100 & & & \\ \hline & & & 105 & 110 & 115 \\ & & & 110 & 111 & 116 \\ & & & 115 & 116 & 116 \end{array}\right], \quad M^{21}_{\substack{mass,21\\ local=18}} = \left[\begin{array}{ccc|ccc} 300 & & & & & \\ & 300 & & & & \\ & & 300 & & & \\ \hline & & & 206 & 211 & 216 \\ & & & 211 & 211 & 216 \\ & & & 216 & 216 & 217 \end{array}\right]$$

(where "local" means CONM2 coord system in field 4 of CONM2 B.D. card)

note: only lower triangle input on CONM2 card

In subr CONM2_PROC_1 these are transformed to basic coords at the mass. The local system for the CONM2's is coord system 18. The transformation to basic from 18 was given earlier:

$$T_{0,18} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & -1 & 0 \end{bmatrix}$$

We want

$$T_{18,0} \equiv T^T_{0,18} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & -1 \\ 0 & 1 & 0 \end{bmatrix}$$

Then

$$I^i_{\substack{mass,i\\ basic}} = T^T_{18,0}\, I^i_{\substack{mass,i,\\ 18}}\, T_{18,0} \qquad \left(I^i = \text{MoI portion of } M^i_{\substack{mass,\\ local}} \right)$$

$$I^{11}_{\substack{mass,11\\ basic}} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & -1 & 0 \end{bmatrix} \begin{bmatrix} 105 & 110 & 115 \\ 110 & 111 & 116 \\ 115 & 116 & 116 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & -1 \\ 0 & 1 & 0 \end{bmatrix} = \begin{bmatrix} 105 & 115 & -110 \\ 115 & 116 & -116 \\ -110 & -116 & 111 \end{bmatrix}$$

$$I^{21}_{\substack{mass,21\\ basic}} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & -1 & 0 \end{bmatrix} \begin{bmatrix} 206 & 211 & 216 \\ 211 & 211 & 216 \\ 216 & 216 & 217 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & -1 \\ 0 & 1 & 0 \end{bmatrix} = \begin{bmatrix} 206 & 216 & -211 \\ 216 & 217 & -216 \\ -211 & -216 & 211 \end{bmatrix}$$

So

$$M^{11}_{\substack{\text{mass,11,}\\ \text{basic}}} = \left[\begin{array}{ccc|ccc} 100 & & & & & \\ & 100 & & & & \\ & & 100 & & & \\ \hline & & & 105 & 115 & -110 \\ & & & 115 & 116 & -116 \\ & & & -110 & -116 & 111 \end{array}\right], \quad M^{21}_{\substack{\text{mass,21,}\\ \text{basic}}} = \left[\begin{array}{ccc|ccc} 300 & & & & & \\ & 300 & & & & \\ & & 300 & & & \\ \hline & & & 206 & 216 & -211 \\ & & & 216 & 217 & -216 \\ & & & -211 & -216 & 211 \end{array}\right]$$

these agree w/ outputs from subr CONM2_PROC_1 for mass, MoI terms in "RCONM2 in basic coords at the mass". Keep in mind that RCONM2 has only lower portion of 3x3 MoI partition and that they are in the order $I_{xx}, I_{yx}, I_{yy}, I_{zx}, I_{zy}, I_{zz}$

In subr CONM2_PROC_2 the above matrices are transformed to the grid in basic and then to the grid in global. The transformations between the mass and grid for the 2 CONM2's are (in basic coords):

$$\begin{bmatrix} u_0 \\ v_0 \\ w_0 \\ \theta_{x_0} \\ \theta_{y_0} \\ \theta_{z_0} \end{bmatrix}_{\text{at mass 11}} = \underbrace{\left[\begin{array}{ccc|ccc} 1 & & & & & -2 \\ & 1 & & & & \\ & & 1 & 2 & & \\ \hline & & & 1 & & \\ & 0 & & & 1 & \\ & & & & & 1 \end{array}\right]}_{T_{11,101}} \begin{bmatrix} u_0 \\ v_0 \\ w_0 \\ \theta_{x_0} \\ \theta_{y_0} \\ \theta_{z_0} \end{bmatrix}_{\text{at GP 101}}, \quad \begin{bmatrix} u_0 \\ v_0 \\ w_0 \\ \theta_{x_0} \\ \theta_{y_0} \\ \theta_{z_0} \end{bmatrix}_{\text{at mass 21}} = \underbrace{\left[\begin{array}{ccc|ccc} 1 & & & & & -4 \\ & 1 & & & & \\ & & 1 & 4 & & \\ \hline & & & 1 & & \\ & & & & 1 & \\ & & & & & 1 \end{array}\right]}_{T_{21,201}} \begin{bmatrix} u_0 \\ v_0 \\ w_0 \\ \theta_{x_0} \\ \theta_{y_0} \\ \theta_{z_0} \end{bmatrix}$$

so

$$M^{11}_{\substack{\text{grid 101}\\ \text{basic}}} = T^T_{11,101} \, M^{11}_{\substack{\text{mass 11,}\\ \text{basic}}} \, T_{11,101}$$

and

$$M^{21}_{\substack{\text{grid 201}\\ \text{basic}}} = T^T_{21,201} \, M^{21}_{\substack{\text{mass 21,}\\ \text{basic}}} \, T_{21,201}$$

$$M^{11}_{\substack{\text{grid 101,}\\ \text{basic}}} = \left[\begin{array}{ccc|ccc} 1 & & & & & \\ & 1 & & & 0 & \\ & & 1 & & & \\ \hline & & 2 & 1 & & \\ & & & & 1 & \\ -2 & & & & & 1 \end{array}\right] \left[\begin{array}{ccc|ccc} 100 & & & & & \\ & 100 & & & 0 & \\ & & 100 & & & \\ \hline & & & 105 & 115 & -110 \\ & 0 & & 115 & 116 & -116 \\ & & & -110 & -116 & 111 \end{array}\right] \left[\begin{array}{ccc|ccc} 1 & & & & & -2 \\ & 1 & & & & \\ & & 1 & 2 & & \\ \hline & & & 1 & & \\ & 0 & & & 1 & \\ & & & & & 1 \end{array}\right] = \left[\begin{array}{ccc|ccc} 100 & & & & & -200 \\ & 100 & & & & \\ & & 100 & 200 & & \\ \hline & & 200 & 505 & 115 & -110 \\ & & & 115 & 116 & -116 \\ -200 & & & -110 & -116 & 511 \end{array}\right]$$

$$M^{31}_{\substack{\text{grid 201,}\\ \text{basic}}} = \left[\begin{array}{ccc|ccc} 1 & & & & & \\ & 1 & & & 0 & \\ & & 1 & & & \\ \hline & & 4 & 1 & & \\ & & & & 1 & \\ -4 & & & & & 1 \end{array}\right] \left[\begin{array}{ccc|ccc} 300 & & & & & \\ & 300 & & & 0 & \\ & & 300 & & & \\ \hline & & & 306 & 216 & -211 \\ & 0 & & 216 & 217 & -216 \\ & & & -211 & -216 & 211 \end{array}\right] \left[\begin{array}{ccc|ccc} 1 & & & & & -4 \\ & 1 & & & & \\ & & 1 & 4 & & \\ \hline & & & 1 & & \\ & 0 & & & 1 & \\ & & & & & 1 \end{array}\right] = \left[\begin{array}{ccc|ccc} 300 & & & & & -1200 \\ & 300 & & & & \\ & & 300 & 1200 & & \\ \hline & & 1200 & 5006 & 216 & -211 \\ & & & 216 & 217 & -216 \\ -1200 & & & -211 & -216 & 5011 \end{array}\right]$$

The MOI terms agree w/ outputs from subr CONM2-PROC-2 for MASS, MOI terms in "RCONM2 in basic coords at the grid ..." . The mass coupling terms are also OK since they are MASS*d values and the d values in RCONM2 are correct

We now need to transform from basic to global at the grid. Global is coord sys 29 so (from earlier)

$$T_{0,29} = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 0 & 0 \end{bmatrix}, \quad \bar{T}_{0,29} = \begin{bmatrix} T_{0,29} & 0 \\ 0 & T_{0,29} \end{bmatrix} = \left[\begin{array}{ccc|ccc} 0 & 1 & 0 & & & \\ 0 & 0 & 1 & & 0 & \\ 1 & 0 & 0 & & & \\ \hline & & & 0 & 1 & 0 \\ & 0 & & 0 & 0 & 1 \\ & & & 1 & 0 & 0 \end{array}\right]$$

so

$$M^{i}_{\substack{\text{grid } j\\ \text{global}=29}} = \bar{T}^{T}_{0,29} \, M^{i}_{\substack{\text{grid } j\\ \text{basic}}} \, \bar{T}_{0,29}$$

$$M''_{\substack{grid\,101,\\ global=29}} = \left[\begin{array}{ccc|ccc} 0 & 0 & 1 & & & \\ 1 & 0 & 0 & & 0 & \\ 0 & 1 & 0 & & & \\ \hline & & & 0 & 0 & 1 \\ & 0 & & 1 & 0 & 0 \\ & & & 0 & 1 & 0 \end{array}\right] \left[\begin{array}{ccc|ccc} 100 & & & & & -200 \\ & 100 & & & & \\ & & 100 & 200 & & \\ \hline & & 200 & 505 & 115 & -110 \\ & & & 115 & 116 & -116 \\ -200 & & & -110 & -116 & 511 \end{array}\right] \left[\begin{array}{ccc|ccc} 0 & 1 & 0 & & & \\ 0 & 0 & 1 & & 0 & \\ 1 & 0 & 0 & & & \\ \hline & & & 0 & 1 & 0 \\ & 0 & & 0 & 0 & 1 \\ & & & 1 & 0 & 0 \end{array}\right] = \left[\begin{array}{ccc|ccc} 100 & & & 0 & 200 & 0 \\ & 100 & & -200 & 0 & 0 \\ & & 100 & 0 & 0 & 0 \\ \hline 0 & -200 & 0 & 511 & -110 & -116 \\ 200 & 0 & 0 & -110 & 505 & 115 \\ 0 & 0 & 0 & -116 & 115 & 116 \end{array}\right]$$

$$M^{201}_{\substack{grid\,201\\ global=29}} = \left[\begin{array}{ccc|ccc} 0 & 0 & 1 & & & \\ 1 & 0 & 0 & & 0 & \\ 0 & 1 & 0 & & & \\ \hline & & & 0 & 0 & 1 \\ & 0 & & 1 & 0 & 0 \\ & & & 0 & 1 & 0 \end{array}\right] \left[\begin{array}{ccc|ccc} 300 & & & & & -1200 \\ & 300 & & & & \\ & & 300 & 1200 & & \\ \hline & & 1200 & 5006 & 216 & -211 \\ & & & 216 & 217 & -216 \\ -1200 & & & 211 & -216 & 5011 \end{array}\right] \left[\begin{array}{ccc|ccc} 0 & 1 & 0 & & & \\ 0 & 0 & 1 & & 0 & \\ 1 & 0 & 0 & & & \\ \hline & & & 0 & 1 & 0 \\ & 0 & & 0 & 0 & 1 \\ & & & 1 & 0 & 0 \end{array}\right] = \left[\begin{array}{ccc|ccc} 300 & & & 0 & 1200 & 0 \\ & 300 & & -1200 & 0 & 0 \\ & & 300 & 0 & 0 & 0 \\ \hline 0 & -1200 & 0 & 5011 & -211 & -216 \\ 1200 & 0 & 0 & -211 & 5006 & 216 \\ 0 & 0 & 0 & -216 & 216 & 217 \end{array}\right]$$

The M011 & M013 terms agree w/ outputs from CONM2_PROC_2 for "RCONM2 in global coords at the grid..."

All terms agree with outputs from subr MGG_MASS_MATRIX for "In MGG_MASS_MATRIX: MGG after processing CONM2's"

Hand Calc of Principal MoI's

Solve
$$\left(I_{CG} - \lambda I\right) Q = 0$$

for PMoI's (λ's) and principal directions, Q.

First get eigenvalues:

$$\begin{vmatrix} I_{11}-\lambda & I_{21} & I_{31} \\ I_{21} & I_{22}-\lambda & I_{32} \\ I_{31} & I_{32} & I_{33}-\lambda \end{vmatrix} = 0$$

$$(I_{11}-\lambda)(I_{22}-\lambda)(I_{33}-\lambda) + I_{21}I_{32}I_{31} + I_{31}I_{32}I_{21} - \left\{ (I_{22}-\lambda)I_{31}^2 + (I_{11}-\lambda)I_{32}^2 + (I_{33}-\lambda)I_{21}^2 \right\} = 0$$

$$-\lambda^3 + (I_{11}+I_{22}+I_{33})\lambda^2 - (I_{11}I_{22}+I_{11}I_{33}+I_{22}I_{33})\lambda + \Big[I_{11}I_{22}I_{33} - (I_{11}-\lambda)I_{32}^2 - (I_{22}-\lambda)I_{31}^2 - (I_{33}-\lambda)I_{21}^2 + 2I_{21}I_{31}I_{32} \Big] = 0$$

$$\lambda^3 - (I_{11}+I_{22}+I_{33})\lambda^2 + (I_{11}I_{22}+I_{11}I_{33}+I_{22}I_{33} - I_{32}^2 - I_{31}^2 - I_{21}^2)\lambda - \Big(I_{11}I_{22}I_{33} - I_{11}I_{32}^2 - I_{22}I_{31}^2 - I_{33}I_{21}^2 + 2I_{21}I_{31}I_{32} \Big) = 0$$

Or
$$\lambda^3 + p\lambda^2 + q\lambda + r = 0$$

where
$$p = -(I_{11}+I_{22}+I_{33})$$
$$q = (I_{11}I_{22}+I_{11}I_{33}+I_{22}I_{33} - I_{21}^2 - I_{31}^2 - I_{32}^2)$$
$$r = -(I_{11}I_{22}I_{33} - I_{11}I_{32}^2 - I_{22}I_{31}^2 - I_{33}I_{21}^2 + 2I_{21}I_{31}I_{32})$$

?

(unfinished - use output from COINMZA-PMOI given earlier)

CORD3-0

As best can be measured on this dwg (within .2") the origins in basic are

CID	Coords of Origin		
	X_0	Y_0	Z_0
23	0	25	5
63	6	25	10
92	10	17	21
46	0	25	10
11	6	6	11
59	0	25	20

✓ : Agrees w/ MYSTRAN

<u>Deflections of Beam (Using basic as global coord. system)</u>

The lateral deflection and slope are:

$$w = \frac{Pl^3}{3EI} = \frac{P}{3}\frac{(10^3)}{(10\times10^6)(2)} = \frac{P}{6}\times10^{-4}$$

$$\theta = \pm\frac{Pl^2}{2EI} = \pm\frac{P}{2}\frac{(10^2)}{(10\times10^6)(2)} = \pm\frac{P}{4}\times10^{-5}$$

The longitudinal displacement u

$$u = \frac{Pl}{AE} = P\frac{(10)}{(1)(10\times10^6)} = 10^{-6}P$$

$\therefore$ $T1_0 = \frac{P}{6}\times10^{-4}$ with $P = 10^{\#}$; $T1_0 = 1.66667\times10^{-4}$ in.

$T2_0 = 10^{-6}P$ with $P = 20^{\#}$; $T2_0 = 2.0\times10^{-5}$ in.

$T3_0 = \frac{P}{6}\times10^{-4}$ with $P = 30^{\#}$; $T3_0 = 5.0\times10^{-4}$ in

$R1_0 = \frac{P}{4}\times10^{-4}$ with $P = 30^{\#}$; $R1_0 = 7.5\times10^{-5}$ in.

$R2_0 = 0$ (no torsional moment)

$R3_0 = -\frac{P}{4}\times10^{-4}$ with $P = 10^{\#}$; $R3_0 = -2.5\times10^{-5}$ in

Check Final Global-To-Basic Transformation

Grid 11: Global is spherical system 46

Coords of G.P. 11 Relative to Origin of Coord 46: $\begin{cases} R = 10 \\ \theta = 90^\circ \\ \phi = 180^\circ \end{cases}$

by inspection (also agrees w/ MYSTRAN)

$$\underbrace{\begin{bmatrix} u_{X_0} \\ u_{Y_0} \\ u_{Z_0} \end{bmatrix}_{GP11}}_{\text{basic}} = \underbrace{\begin{bmatrix} 0 & -1 & 0 \\ 0 & 0 & 1 \\ -1 & 0 & 0 \end{bmatrix}}_{\text{By inspection. $$A_{3,0} = A_{1,0} + T_{0-1} A_{3,1}$$

$$= \begin{Bmatrix} 5 \\ 6 \\ 10 \end{Bmatrix} + \begin{bmatrix} 0 & 0 & 1 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix} \begin{Bmatrix} 18 \\ 35 \\ -3 \end{Bmatrix} = \begin{Bmatrix} 5 \\ 6 \\ 10 \end{Bmatrix} + \begin{Bmatrix} -3 \\ 18 \\ 35 \end{Bmatrix} = \begin{Bmatrix} 2 \\ 24 \\ 45 \end{Bmatrix}$$

GUYAN-01

GUYAN-01 2 Cell beam checkout of Guyan reduction algorithm (2 ASET DOF's)

(Grids ordered 103, 101, 102
DOF's 103-T2 and 103 R3 are A-set

$E = 10\times10^6$ (both CBAR's)
$I = 0.1$ (" ")

The free-free stiffness matrix for each beam is: (bending in 1 plane)

$$K_{ee} = \begin{array}{c} \begin{array}{cccc} v_a & \theta_{z_a} & v_b & \theta_{z_b} \end{array} \\ \begin{bmatrix} 12EI/l^3 & 6EI/l^2 & -12EI/l^3 & 6EI/l^2 \\ 6EI/l^2 & 4EI/l & -6EI/l^2 & 2EI/l \\ -12EI/l^3 & -6EI/l^2 & 12EI/l^3 & -6EI/l^2 \\ 6EI/l^2 & 2EI/l & -6EI/l^2 & 4EI/l \end{bmatrix} \end{array} \begin{array}{c} v_a \\ \theta_{z_a} \\ v_b \\ \theta_{z_b} \end{array}$$

Using E, I, l above:

$$K_{ee} = \begin{bmatrix} 12000 & 60000 & -12000 & 60000 \\ 60000 & 400000 & -60000 & 200000 \\ -12000 & -60000 & 12000 & -60000 \\ 60000 & 200000 & -60000 & 400000 \end{bmatrix}$$

for CBAR 11 & 12

The K_{ff} stiffness matrix is

$$K_{ff} = \begin{array}{c} \begin{array}{cccc} 102\text{-}T2 & 102\text{-}R3 & 103\text{-}T2 & 103\ R3 \end{array} \\ \left[\begin{array}{cccc} 24000 & 0 & -12000 & 60000 \\ 0 & 800000 & -60000 & 200000 \\ -12000 & -60000 & 12000 & -60000 \\ 60000 & 200000 & -60000 & 400000. \end{array}\right] \end{array} \begin{array}{l} 102\text{-}T2 \\ 102\text{-}R3 \\ 103\text{-}T2 \\ 103\text{-}R3 \end{array} \quad P_f = \left\{\begin{array}{c} 2. \\ 0 \\ 3. \\ 0 \end{array}\right\} \begin{array}{l} 102\text{-}T2 \\ 102\text{-}R3 \\ 103\text{-}T2 \\ 103\text{-}R3 \end{array}$$

Rearrange according to the grid order run in GUYAN-01.F06:

$$K_{ff} = \begin{array}{c} \begin{array}{cccc} 103\text{-}T2 & 103\text{-}R3 & 102\text{-}T2 & 102\text{-}R3 \end{array} \\ \left[\begin{array}{cccc} 12000 & -60000 & -12000 & -60000 \\ -60000 & 400000 & 60000 & 200000 \\ -12000 & 60000 & 24000 & 0 \\ -60000 & 200000 & 0 & 800000 \end{array}\right] \end{array} \begin{array}{l} 103\text{-}T2 \\ 103\text{-}R2 \\ 102\text{-}T2 \\ 102\text{-}R3 \end{array} , \quad P_f = \left\{\begin{array}{c} 3. \\ 0. \\ 2. \\ 0. \end{array}\right\} \begin{array}{l} 103\text{-}T2 \\ 103\text{-}R3 \\ 102\text{-}T2 \\ 102\text{-}R3 \end{array}$$

$$K_{ff} = \begin{bmatrix} \bar{K}_{aa} & K_{ao} \\ K_{ao}^T & K_{oo} \end{bmatrix} , \quad P_f = \begin{Bmatrix} \bar{P}_a \\ P_o \end{Bmatrix} , \quad u_f = \begin{Bmatrix} u_a \\ u_o \end{Bmatrix}$$

Solve for u_o then u_a

$$u_o = K_{oo}^{-1} P_o - K_{oo}^{-1} K_{ao}^T u_a \equiv u_o^0 + G_{oa} u_a$$

where $\quad u_o^0 = K_{oo}^{-1} P_o$

and $\quad G_{oa} = -K_{oo}^{-1} K_{ao}^T$

$$K_{aa} u_a = P_a \quad \begin{cases} K_{aa} = \bar{K}_{aa} + K_{ao} G_{oa} \\ P_a = \bar{P}_a + G_{oa}^T P_o \end{cases}$$

By comparison:

$$\bar{K}_{aa} = \begin{bmatrix} 12000 & -60000 \\ -60000 & 400000 \end{bmatrix}, \quad \bar{P}_a = \begin{Bmatrix} 3 \\ 0 \end{Bmatrix}$$

$$K_{ao} = \begin{bmatrix} -12000 & -60000 \\ 60000 & 200000 \end{bmatrix}$$

$$K_{oo} = \begin{bmatrix} 24000 & 0 \\ 0 & 800000 \end{bmatrix}, \quad P_o = \begin{Bmatrix} 2 \\ 0 \end{Bmatrix}$$

Invert K_{oo}:

$$K_{oo}^{-1} = 10^{-6} \begin{bmatrix} 41.666667 & 0 \\ 0 & 1.25 \end{bmatrix}, \quad u_{o_0} = K_{oo}^{-1} P_o = 10^{-5} \begin{Bmatrix} 8.333333 \\ 0 \end{Bmatrix}$$

Then

$$G_{oa} = -K_{oo}^{-1} K_{ao}^T = -10^{-6} \begin{bmatrix} 41.666667 & 0 \\ 0 & 1.25 \end{bmatrix} \begin{bmatrix} -12000 & 60000 \\ -60000 & 200000 \end{bmatrix}$$

$$G_{oa} = \begin{bmatrix} .5 & -2.5 \\ .075 & -.25 \end{bmatrix}$$ QED (from GUYAN-01.506)

$$K_{ao} G_{oa} = \begin{bmatrix} -12000 & -60000 \\ 60000 & 200000 \end{bmatrix} \begin{bmatrix} .5 & -2.5 \\ .075 & -.25 \end{bmatrix} = \begin{bmatrix} -10500 & 45000 \\ 45000 & -200000 \end{bmatrix}$$

$$G_{oa}^T P_o = \begin{bmatrix} .5 & .075 \\ -2.5 & -.25 \end{bmatrix} \begin{Bmatrix} 2 \\ 0 \end{Bmatrix} = \begin{Bmatrix} 1 \\ -5 \end{Bmatrix}$$

Then

$$K_{aa} = \bar{K}_{aa} + K_{ao}G_{oa} = \left[\begin{array}{c|c} 12000 & -60000 \\ \hline -60000 & 400000 \end{array}\right] + \left[\begin{array}{c|c} -10500 & 45000 \\ \hline 45000 & -200000 \end{array}\right]$$

$$\therefore K_{aa} = \left[\begin{array}{c|c} 1500 & -15000 \\ \hline -15000 & 200000 \end{array}\right]$$ QED from GUYAN-01.F06

and

$$P_a = \bar{P}_a + G_{oa}^T P_o = \begin{Bmatrix} 3 \\ 0 \end{Bmatrix} + \begin{bmatrix} .5 & .075 \\ -2.5 & -.25 \end{bmatrix} \begin{Bmatrix} 2 \\ 0 \end{Bmatrix} = \begin{Bmatrix} 3 \\ 0 \end{Bmatrix} + \begin{Bmatrix} 1 \\ -5 \end{Bmatrix}$$

$$\therefore P_a = \begin{Bmatrix} 4 \\ -5 \end{Bmatrix}$$ QED from GUYAN-01.F06

$$u_a = K_{aa}^{-1} P_a$$

$$K_{aa}^{-1} = \frac{1}{\underbrace{(1500)(200000)}_{3\times10^8}-\underbrace{(15000)^2}_{2.25\times10^8}} \left[\begin{array}{c|c} 200000 & 15000 \\ \hline 15000 & 1500 \end{array}\right] = 10^{-3}\begin{bmatrix} 2.666667 & .2000000 \\ .2000000 & .0200000 \end{bmatrix}$$

$$u_a = 10^{-3}\begin{bmatrix} 2.666667 & .2000000 \\ .2000000 & .0200000 \end{bmatrix}\begin{Bmatrix} 4 \\ -5 \end{Bmatrix} = \begin{Bmatrix} 9.666667\times10^{-3} \\ 7.000000\times10^{-4} \end{Bmatrix} \begin{matrix} 103\text{-}T2 \\ 103\text{-}R3 \end{matrix}$$ agree w/ MYSTRAN

$$u_o = u_o^o + G_{oa}u_a = \begin{Bmatrix} 8.333333\times10^{-5} \\ 0 \end{Bmatrix} + \begin{bmatrix} .5 & -2.5 \\ .075 & -.25 \end{bmatrix}\begin{Bmatrix} 9.666667\times10^{-3} \\ 7.000000\times10^{-4} \end{Bmatrix}$$

Independent Solution

Calculate theoretical displacements of beam from beam theory:

at tip $v = \dfrac{Pl^3}{3EI} + \dfrac{Ml^2}{2EI}$

$$\theta_z = \frac{Pl^2}{2EI} + \frac{Ml}{EI}$$

Displ at G.P. 102 is found from:

$$\therefore v_{102} = \frac{(5)(10^3)}{(3)(10^7)(.1)} + \frac{(30)(10^2)}{(2)(10^7)(.1)} = 10^{-3}\left(\frac{5}{3} + 1.5\right) = 3.1666667\times10^{-3} \text{ QED}$$

$$\theta_{z_{102}} = \frac{(5)(10^2)}{(2)(10^7)(.1)} + \frac{(30)(10)}{(10^7)(.1)} = 10^{-4}(2.5 + 3) = 5.5\times10^{-4} \text{ QED}$$

Displ at G.P. 103 is found from

$$v_{103} = v_{102} + 10\theta_{z_{102}} + \left(\frac{Pl^3}{3EI}\right)_{\substack{P=3\\ l=10}} = 3.1666667\times10^{-3} + 5.5\times10^{-3} + \frac{(3)(1000)}{3(10^7)(.1)} = 9.666667\times10^{-3} \text{ QED}$$

$$\theta_{z_{103}} = \theta_{z_{102}} + \left(\frac{Pl^2}{2EI}\right)_{\substack{P=3\\ l=10}} = 5.5\times10^{-4} + \frac{(3)(100)}{2(10^7)(.1)} = 7.0\times10^{-4} \text{ QED}$$

GUYAN-03

GUYAN-03: Eigenvalues of 2-DOF A-Set Beam from GUYAN-01
(GIV, MGIV, INV)

$$\text{A-set} = \begin{bmatrix} v_{103} \\ \theta_{z_{103}} \end{bmatrix}, \quad \text{F-set} = \begin{bmatrix} v_{102} \\ \theta_{z_{102}} \\ v_{103} \\ \theta_{z_{103}} \end{bmatrix}$$

$E = 10 \times 10^6$, $\gamma = 0.1$ (wgt density on MAT1 card) } both Bars

$A = 0.01$, $I = 0.1$

There are no CONM2's so mass matrix is due to elem. mass only, Each BAR mass

$$m_e = A \times \gamma \times l = (.01)(.1)(10) = .01 \text{ lb}$$

and is split evenly between the 2 connecting grids. Therefore:

$$M_{tt} = \frac{1}{386} \begin{array}{c} \begin{array}{cccc} 103\text{-}T2 & 103\text{-}R3 & 102\text{-}T2 & 102\text{-}R3 \end{array} \\ \begin{bmatrix} 0.005 & & & \\ & 0 & & \\ & & 0.01 & \\ & & & 0 \end{bmatrix} \end{array} \begin{array}{l} 103\text{-}T2 \\ 103\text{-}R3 \\ 102\text{-}T2 \\ 102\text{-}R3 \end{array} = \begin{bmatrix} \bar{M}_{aa} & M_{ao} \\ M_{ao}^T & M_{oo} \end{bmatrix}$$

where

$$\bar{M}_{aa} = \frac{1}{386}\begin{bmatrix} 0.005 & 0 \\ 0 & 0 \end{bmatrix}, \quad M_{oo} = \frac{1}{386}\begin{bmatrix} 0.01 & 0 \\ 0 & 0 \end{bmatrix}, \quad M_{ao} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$$

and the reduced A-set mass matrix is:

$$M_{aa} = \bar{M}_{aa} + M_{ao}G_{oa} + (M_{ao}G_{oa})^T + G_{oa}^T M_{oo} G_{oa}$$

where

$$G_{oa} = \begin{bmatrix} .5 & -2.5 \\ .075 & -.25 \end{bmatrix} \quad \text{(see GUYAN-01 problem)}$$

$$G_{oa}^T M_{oo} G_{oa} = \frac{1}{386}\begin{bmatrix} .5 & .075 \\ -2.5 & -.25 \end{bmatrix}\begin{bmatrix} 0.01 & 0 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} .5 & -2.5 \\ .075 & -.25 \end{bmatrix} = \frac{1}{386}\begin{bmatrix} .0025 & -.0125 \\ -.0125 & .0625 \end{bmatrix}$$

$$\therefore M_{aa} = \frac{1}{g}\begin{bmatrix} .0075 & -.0125 \\ -.0125 & .0625 \end{bmatrix}, \quad \frac{1}{g} = .002591$$

$$K_{aa} = \begin{bmatrix} 1500 & -15000 \\ -15000 & 200000 \end{bmatrix}$$ See GUYAN-01 problem)

So the eigenvalue problem is

$$(K_{aa} - \lambda M_{aa}) u_a = 0$$

which requires

$$|K_{aa} - \lambda M_{aa}| = 0$$

or

$$\begin{vmatrix} 1500g - .0075\lambda & -15000g + .0125\lambda \\ -15000g + .0125\lambda & 200000g - .0625\lambda \end{vmatrix} = 0$$

Expand

$$[1500g - .0075\lambda][200000g - .0625\lambda] - [-15000g + .0125\lambda]^2 = 0$$

Or

$$3\times10^8 g^2 - (1500 + 93.75)g\lambda + .00046875\lambda^2 - 2.25\times10^8 g^2 + 375\lambda - .00015625\lambda^2 = 0$$

$$.0003125\lambda^2 - 1218.75g\lambda + .75\times10^8 g^2 = 0$$

Divide by .000625

$$\lambda^2 - 3.9\times10^6 g\lambda + 0.24\times10^{12} g^2 = 0$$

or

$$\lambda^2 + b\lambda + c = 0 \quad \begin{cases} b = -3.9\times10^6 g \\ c = 0.24\times10^{12} g^2 \end{cases}$$

$$\lambda_{1,2} = -\frac{b}{2} \pm \sqrt{\left(\frac{b}{2}\right)^2 - c} \qquad f_{1,2} = \frac{1}{2\pi}\sqrt{-\frac{b}{2} \pm \sqrt{\left(\frac{b}{2}\right)^2 - c}}$$

$$\lambda_{1,2} = 1.95\times10^{6}g \pm \sqrt{(1.95\times10^{6}g)^2 - .24\times10^{12}g^2}$$

$$= \left[1.955\times10^{6} \pm \sqrt{3.8025\times10^{12} - .24\times10^{12}}\right]g$$

$$= \left[1.95\times10^{6} \pm \sqrt{3.5625\times10^{12}}\right]g$$

$$= (1.95 \pm 1.887459860881769$$

$$\lambda_{1,2} = \begin{Bmatrix} 6.254139 & \times10^{4}g \\ 3.837459 & \times10^{6}g \end{Bmatrix} \quad f_{1,2} = \frac{1}{2\pi}\sqrt{\lambda_{1,2}} = \begin{Bmatrix} 39.80191 \\ 311.7758 \end{Bmatrix}$$ exact in MYSTRAN

The eigenvectors are found from

$$(K - \lambda_i M)\phi^i = 0$$

$$\begin{bmatrix} 1500 - .0075\lambda_i & -15000 + .0125\lambda_i \\ -15000 + .0125\lambda_i & 200000 - .0625\lambda_i \end{bmatrix} \begin{Bmatrix} \phi_{1i} \\ \phi_{2i} \end{Bmatrix} = \begin{Bmatrix} 0 \\ 0 \end{Bmatrix}$$

Let $\phi_{1i} = 1.0$

$$(1500 - .0075\lambda_i) + (-15000 + .0125\lambda_i)\phi_{2i} = 0$$

$$\phi_{2i} = \frac{1500 - .0075\lambda_i}{15000 - .0125\lambda_i}$$

$$\phi_{2i} = \begin{cases} \dfrac{1030.939}{14218.23} = .07250824 & i=1 \\[2ex] \dfrac{-27280.94}{-32968.24} = .8274916 & i=2 \end{cases}$$ Same (diff in 7th digit) as MYSTRAN

For the A-set

$$\phi^1 = \begin{Bmatrix} 1 \\ .07250824 \end{Bmatrix} \begin{matrix} 103\text{-}T2 \\ 103\text{-}R3 \end{matrix}$$

$$\phi^2 = \begin{Bmatrix} 1 \\ .8274916 \end{Bmatrix} \begin{matrix} 103\text{-}T2 \\ 103\text{-}R3 \end{matrix}$$

The gen. mass matrix is

$$\phi_a^T M_{aa} \phi_a = \frac{1}{g}\begin{bmatrix} 1 & .07250824 \\ 1 & .8274916 \end{bmatrix}\begin{bmatrix} .0075 & -.0125 \\ -.0125 & .0625 \end{bmatrix}\begin{bmatrix} 1 & 1 \\ .07250824 & .8274916 \end{bmatrix}$$

$$= \frac{1}{g}\begin{bmatrix} & \text{"} & \end{bmatrix}\begin{bmatrix} .006593647 & -.002843675 \\ -.007968235 & .03921823 \end{bmatrix}$$

$$= \frac{1}{g}\begin{bmatrix} .006015884 & -3\times10^{-8} \\ -5\times10^{-10} & .02960911 \end{bmatrix}$$

(MATLAB, w/ double prec., gets the diag. the same (to 7 sig. figs) and the off-diags to 1.1×10^{-18})

GUYAN-03 : Cholesky Decomp of M

$$M = LDL^T = (LD^{1/2})(LD^{1/2})^T = M^{1/2}M^{T/2}$$

$$M = \frac{1}{g}\begin{bmatrix} 1 & 0 \\ l_{21} & 1 \end{bmatrix}\underbrace{\begin{bmatrix} d_{11} & 0 \\ 0 & d_{22} \end{bmatrix}\begin{bmatrix} 1 & l_{21} \\ 0 & 1 \end{bmatrix}}_{\begin{bmatrix} d_{11} & d_{11}l_{21} \\ 0 & d_{22} \end{bmatrix}}$$

$$15.98942 \times 10^{-6}\alpha = 1$$

$$\alpha = 6.254136 \times 10^{4} = \lambda \quad (\text{since } \lambda_0 = 0)$$

(MYSTRAN gets $\lambda = 6.254139 \times 10^{4}$)

RADIAL-BARS-CYL-GLOBAL-END-LOADS

RADIAL-BARS-CYL-GLOBAL-END-LOADS 6 radial bars attached to a central point which is grounded. Each bar has end loads. Global is cyl.

Fig 1

CBARS 11-16 : J=
L=10
A=.4
I_1=4
I_2=5
E=1x10^7

Plane 1 of BARS is r-z
" 2 " " is r-θ

Grid 101 SPC'd to in all 6 DOF

The global coord sys is CORD2C 25 :

Fig 2

The CBARS have end loads that are all the same and are specified in coord 25

Look at a typical CBAR:

End a for all bars is G.P. 101 and is constrained in all 6 DOF. The applied loads (at the 201-206 G.P.'s) are all the same

$$F_r = 4.$$

$$F_\theta = 6.$$

$$F_z = 12$$

$$M_r = 3.$$

$$M_\theta = 6.$$

$$M_z = 9.$$

The displ's of each CBAR at end b are:

$$u_{r_{25}} = \frac{F_r L}{AE} = \frac{(4)(10)}{(.4)(10^7)} = 1\times10^{-5}$$

$$u_{\theta_{25}} = \frac{F_\theta L^3}{3EI_2} + \frac{M_z L^2}{2EI_2} = \frac{(6)(1000)}{(3)(10^7)(5)} + \frac{(9)(100)}{(2)(10^7)(5)} = 4\times10^{-5} + .9\times10^{-5} = 4.9\times10^{-5}$$

$$u_{z_{25}} = \frac{F_z L^3}{3EI_1} - \frac{M_\theta L^2}{2EI_1} = \frac{(12)(1000)}{(3)(10^7)(4)} - \frac{(6)(100)}{(2)(10^7)(4)} = 10\times10^{-5} - .75\times10^{-5} = 9.25\times10^{-5}$$

$$\theta_{r_{25}} = \frac{M_r L}{GJ} = \frac{(3)(10)}{(4\times10^6)(1.5)} = 5\times10^{-6}$$

$$\theta_{\theta_{25}} = -\frac{F_z L^2}{2EI_1} + \frac{M_\theta L}{EI_1} = -\frac{(12)(100)}{(2)(10^7)(4)} + \frac{(6)(10)}{(10^7)(4)} = -1.5\times10^{-5} + .15\times10^{-5} = -1.35\times10^{-5}$$

$$\theta_{z_{25}} = \frac{F_\theta L^2}{2EI_2} + \frac{M_z L}{EI_2} = \frac{(6)(100)}{(2)(10^7)(5)} + \frac{(9)(10)}{(10^7)(5)} = 6\times10^{-6} + 1.8\times10^{-6} = 7.8\times10^{-6}$$

The constr. forces can be deduced from the following

1) effect of F_r forces is 0 since they all pass thru G.P. 101 and sum to 0

2) " " F_θ forces is only to produce a M_z mom. about G.P. 101

3) " " F_z forces is to produce a F_z const force at G.P. 101 $= \sum_{elem} F_z$

4) " " M_r mom's cancell

5) " " M_θ " "

6) " " M_z " adds to $M_{z_{101}}$ caused by elem F_θ in (2) above

$$\therefore F_{r_{101}} = 0$$

$$F_{\theta_{101}} = 0$$

$$F_{z_{101}} = -6 F_{z_{elem}} = (6)(12) = -72$$

$$M_{r_{101}} = 0$$

$$M_{\theta_{101}} = 0$$

$$M_{z_{101}} = -6 F_{\theta_{elem}} L - 6 M_z = -6\left[(6)(10) + 9\right] = -414.$$

SPC forces at G.P. 101

(-) sign due to these reacting applied forces

	Grid	CID	T1	T2	T3	R1	R2	R3
Displ.	201-206	25	1×10^{-5}	4.9×10^{-5}	9.25×10^{-5}	5×10^{-6}	-1.35×10^{-5}	7.8×10^{-6}
Applied Load	201-206	25	4.	6.	12.	3.	6.	9
SPC Force	201-206	25	0	0	-72	0	0	-414

Elem Engineering Forces

Elem engr forces can be deduced from Fig 3 considering

plane 1 is x_e-y_e (or r_{2r}, z_{2r})

plane 2 is x_e-z_e

+ bending puts compr on top (at $+y_e$, or $+z_e$)

Thus, at end b

M_{1_b} = mom in plane 1 at end b = $-M_\theta = -6.$

M_{2_b} = " " " 2 " " b = $-M_z = -9.$

V_1 = shear in plane 1 = $F_z = 12.$

V_2 = " " " 2 = $-F_\theta = -6.$

At end a

$$M_{1_a} = M_{1_b} + V_1 L = -6 + (12)(10) = 114.$$

$$M_{2_a} = M_{2_b} + V_2 L = -9 - (6)(10) = -69$$

and torque, axial force:

$$T = M_r = 3. \quad , \quad P = F_r = 4.$$

Elem Engr Forces

Elem	Bend. Mom - End a		Bend. Mom - End b		Shear		Axial Force	Torque
	plane 1	plane 2	plane 1	plane 2	plane 1	plane 2		
12-16	114.	-69.	-6.	-9.	12.	-6.	4.	3.

Elem Stresses

The locations of the 4 stress pts:

pt 1 : $(.2, -.3)_{y_e, z_e}$
pt 2 : $(.2, .3)_{y_e, z_e}$
pt 3 : $(-.2, .3)_{y_e, z_e}$
pt 4 : $(-.2, -.3)_{y_e, z_e}$

The moments are

$I_1 = 4$
$I_2 = 5$

For a point $p: (y_e, z_e)$ on the cross-section the stresses at end a and end b are

$$\sigma_{a_p} = -\left(\frac{M_{1a} y_e}{I_1} + \frac{M_{2a} z_e}{I_2}\right) \quad (I_{12} = 0) \qquad M_{1a} = 114,\ M_{2a} = -69.$$

$$\sigma_{b_p} = -\left(\frac{M_{1b} y_e}{I_1} + \frac{M_{2b} z_e}{I_2}\right) \quad \text{"} \qquad M_{1b} = -6,\ M_{2b} = -9$$

So;

$$\sigma_{a_1} = -\frac{(114)(.2)}{4} - \frac{(-69)(-.3)}{5} = -5.70 - 4.14 = -9.84, \quad \sigma_{b_1} = -\frac{(-6)(.2)}{4} - \frac{(-9)(-.3)}{5} = 0.30 - 0.54 = -0.24$$

$$\sigma_{a_2} = -\frac{(114)(.2)}{4} - \frac{(-69)(.3)}{5} = -5.70 + 4.14 = -1.56, \quad \sigma_{b_2} = -\frac{(-6)(.2)}{4} - \frac{(-9)(.3)}{5} = 0.30 + 0.54 = 0.84$$

$$\sigma_{a_3} = -\frac{(114)(-.2)}{4} - \frac{(-69)(.3)}{5} = 5.70 + 4.14 = 9.84, \quad \sigma_{b_3} = -\frac{(-6)(-.2)}{4} - \frac{(-9)(.3)}{5} = -0.30 + 0.54 = 0.24$$

$$\sigma_{a_4} = -\frac{(114)(-.2)}{4} - \frac{(-69)(-.3)}{5} = 5.70 - 4.14 = 1.56, \quad \sigma_{b_4} = -\frac{(-6)(-.2)}{4} - \frac{(-9)(-.3)}{5} = -0.30 - 0.54 = -0.84$$

and

$$\sigma_{axial} = \frac{P_{axial}}{A} = \frac{4}{.4} = 10$$

RADIAL-BARS-CYL-GLOBAL-RB-DISP

RADIAL-BARS-CYL-GLOBAL-RB-DISP : 6 radial bars attached to a central point which is given RB displ. in all 6 DOF's. Global Coord Sys is cylindrical

CBAR's 11-16: $L = 10$, $A = .4$, $I_1 = 4.$, $I_2 = 5.$, $E = 1\times10^7$

Plane 1 of BARS is r-z
" 2 " " " r-θ

The global system is COORDSE 25:

Grid 101 is given 1.0 displ in all 6 cyl. DOF's. Output displ's are in sys. 25 and when F06 file is scanned they don't look RB since all of a given rotation are not equal (except for R3). However, this is OK since R1 = rot. about r and R2 = rot about θ and these are diff. for each grid.

Look at BUG file UEB - which shows elem displ's in basic. Then they do show all R1 = 1.0, all R2 = 1.0, all R3 = 1.0 which is. RB.

RBE2-01-CBAR-01

RBE2-01-CBAR-01- (With G.P. 102, comp 1,2,6 dependent, shows singular K_{NN} after LINK1 AUTOSPC)

$A = .01$, $I_1 = I_2 = 0.1$, $E = 10 \times 10^6$

$$K_{GG} u_G = 10^4 \begin{array}{c} \\ \\ \\

$$K_{GG} = \begin{bmatrix} \bar{K}_{NN} & K_{NM} \\ K_{NM}^T & K_{MM} \end{bmatrix}, \quad u_G = \begin{bmatrix} I \\ G_{MN} \end{bmatrix} u_N \tag{2}$$

$$\bar{K}_{NN} = 10^4 \left[\begin{array}{ccc|ccc|ccc} 1 & & & & & & & & \\ & 1.2 & & & & 6 & & 0 & \\ & & 1.2 & & -6 & & -1.2 & & -6 \\ & & & 3.759 & & & & -3.759 & \\ & & -6 & & 40 & & 6 & & 20 \\ & 6 & & & & 40 & & & \\ \hline & & -1.2 & & 6 & & 1.2 & & 6 \\ & & & & & & & 3.759 & \\ & & -6 & & 20 & & 6 & & 40 \\ \hline & & & 0 & & & & 0 & & & 0 & \end{array}\right], \quad K_{NM} = 10^4 \left[\begin{array}{c} -1 \\ -1.2 \quad 6 \\ \\ -6 \quad 20 \\ \hline 0 \\ \hline 0 \end{array}\right], \quad K_{MM} = 10^4 \begin{bmatrix} 1 & \\ 1.2 & -6 \\ -6 & 40 \end{bmatrix} \tag{3}$$

The RBE2 has components 1,2,6 constrained at G.P. 102:

$$\begin{aligned} u_{102} &= u_{103} \\ v_{102} &= v_{103} - 110\,\theta_{z_{103}} \\ \underbrace{\theta_{z_{102}}}_{u_M} &= \theta_{z_{102}} \end{aligned} \tag{4}$$

$$\begin{Bmatrix} u_{102} \\ v_{102} \\ \theta_{z_{102}} \end{Bmatrix} = \underbrace{\left[\begin{array}{c|c|ccc} & & 1 & & \\ & & & 1 & -110 \\ & & & & 1 \end{array}\right]}_{G_{MN}} \begin{Bmatrix} u_{101} \\ v_{101} \\ w_{101} \\ \theta_{x_{101}} \\ \theta_{y_{101}} \\ \theta_{z_{101}} \\ \hline w_{102} \\ \theta_{x_{102}} \\ \theta_{y_{102}} \\ \hline u_{103} \\ v_{103} \\ w_{103} \\ \theta_{x_{103}} \\ \theta_{y_{103}} \\ \theta_{z_{103}} \end{Bmatrix} \tag{5}$$

$$K_{NN} = \bar{K}_{NN} + K_{NM}G_{MN} + (K_{NM}G_{MN})^T + G_{MN}^T K_{MM} G_{MN}$$

$$K_{NM}G_{MN} = 10^4 \left[\begin{array}{c|c|c} \begin{matrix} -1 & & \\ & -1.2 & 6 \\ & -6 & 20 \end{matrix} & 0 & 0 \\ \hline 0 & 0 & \begin{matrix} 1 & & \\ & 1 & \\ & & -110 \\ & & 1 \end{matrix} \\ \hline 0 & & \end{array}\right] \qquad (6)$$

$$= 10^4 \left[\begin{array}{c|c|c} 0 & 0 & \begin{matrix} -1 & & \\ & -1.2 & 138 \\ & -6 & 680 \end{matrix} \\ \hline 0 & 0 & 0 \\ \hline 0 & 0 & 0 \end{array}\right] \qquad (7)$$

$$G_{MN}^{T} K_{MM} G_{MN} = 10^{4} \left[\begin{array}{c|c|c|c} 0 & & & \\ \hline 0 & \begin{bmatrix} 1 & & \\ & 1.2 & -6 \\ & -6 & 40 \end{bmatrix} & \begin{bmatrix} 0 \end{bmatrix} & \begin{bmatrix} 0 \end{bmatrix} \\ \hline \begin{matrix} 1 & & \\ & 1 & \\ & & \\ & & \\ & -110 & 1 \end{matrix} & & \begin{bmatrix} 0 \end{bmatrix} & \begin{bmatrix} 0 \end{bmatrix} \end{array}\right] \begin{bmatrix} 1 & & \\ & 1 & -110 \\ & & 1 \end{bmatrix} \begin{bmatrix} 1 & & \\ & 1.2 & -138 \\ & -6 & 700 \end{bmatrix} \tag{8}$$

$$= 10^{4} \left[\begin{array}{c|c|c|c} 0 & 0 & 0 & \\ \hline 0 & 0 & 0 & \\ \hline 0 & 0 & \begin{matrix} 1 & & \\ & 1.2 & -138 \\ & -138 & 15880 \end{matrix} \end{array}\right] \tag{9}$$

$$
\therefore K_{NN} = 10^4 \left[\begin{array}{cccccc|ccc|cccccc}
 & & & & & & & & & & & & & & \\

 & & & & & & & & & & & & 0 & & \\
 & & & & & & & & & & & & & 0 & \\
 & 114 & & & & 560 & & & & & -138 & & & & 15880
\end{array}\right]
\begin{array}{c}
1 \\ 2 \\ 3 \\ 4 \\ 5 \\ 6 \\ 3 \\ 4 \\ 5 \\ 1 \\ 2 \\ 3 \\ 4 \\ 5 \\ 6
\end{array}
\begin{array}{c}
101 \\ \\ \\ \\ \\ \\ 102 \\ \\ \\ 103 \\ \\ \\ \\ \\ \\
\end{array}
\quad 15 \times 15
$$

$$
, \; P_n = \bar{P}_n \quad (P_m = 0)
\qquad
\left[\begin{array}{c}
0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ \hline 0 \\ 0 \\ 0 \\ \hline 1000 \\ 3 \\ 0 \\ 0 \\ 0 \\ 0
\end{array}\right] \quad (10)
$$

Note the 3 singular DOF's in K_{NN} (Grid 103 comps 3,4,5). In addition, prior to the reduction of K_{GG} to K_{NN}, Grid 103 had <u>no</u> stiffness but comps 1,2,6 now have stiffness due to the m set reduction.

The AUTOSPC_NSET processor will AUTOSPC comps 3,4,5 at 103. The SPC at 101 eliminates all 6 comps at grid 101 to give the f-set stiffness:

$$K_{FF}u_F = P_F \Rightarrow 10^4 \begin{array}{c} \begin{array}{cccccc} & 102 & & & 103 & \\ 3 & 4 & 5 & 1 & 2 & 6 \end{array} \\ \left[\begin{array}{ccc|ccc} 1.2 & & 6 & & & \\ & 3759 & & & 0 & \\ 6 & & 40 & & & \\ \hline & & & 1 & & \\ & 0 & & & 1.2 & -138 \\ & & & & -138 & 15880 \end{array}\right] \end{array} \begin{bmatrix} w_{102} \\ \theta_{x_{102}} \\ \theta_{y_{102}} \\ u_{103} \\ v_{103} \\ \theta_{z_{103}} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 1000 \\ 3 \\ 0 \end{bmatrix} \begin{array}{c} P_{z_{102}} \\ M_{x_{102}} \\ M_{y_{102}} \\ P_{x_{103}} \\ P_{y_{103}} \\ M_{z_{103}} \end{array} \quad (11)$$

Grid 102 comps 3-4-5 have no load and are not coupled to 103 comps 1-2-6 so

$$\begin{bmatrix} w_{102} \\ \theta_{x_{102}} \\ \theta_{y_{102}} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix} \quad (12)$$

Solve for 103 1-2-6:

$$\begin{bmatrix} 1 & & \\ & 1.2 & -138 \\ & -138 & 15880 \end{bmatrix} \begin{bmatrix} u_{103} \\ v_{103} \\ \theta_{z_{103}} \end{bmatrix} = 10^{-4} \begin{bmatrix} 1000 \\ 3 \\ 0 \end{bmatrix} \quad (13)$$

$$\therefore u_{103} = 0.1 \quad (14)$$

Mult row 1 by $\frac{138}{1.2}$ and add to row 3 to get

$$\begin{bmatrix} 1.2 & -138 \\ 0 & \left(15880 - \frac{138^2}{1.2}\right) \end{bmatrix} \begin{bmatrix} v_{103} \\ \theta_{z_{103}} \end{bmatrix} = 10^{-4} \begin{bmatrix} 3 \\ \left(\frac{(3)(138)}{1.2}\right) \end{bmatrix} \quad (15)$$

$$\begin{bmatrix} 1.2 & -138 \\ 0 & 10 \end{bmatrix} \begin{Bmatrix} v_{103} \\ \theta_{z_{103}} \end{Bmatrix} = \begin{Bmatrix} 3 \\ 345 \end{Bmatrix} \times 10^{-4} \tag{16}$$

$$\therefore \theta_{z_{103}} = 3.45 \times 10^{-3} \tag{17}$$

Subst this into 1st row:

$$1.2\, v_{103} - 138(3.45 \times 10^{-3}) = 3 \times 10^{-4}$$

$$v_{103} = \frac{1}{1.2}\left[4761 + 3\right]10^{-4} = 0.397 \tag{18}$$

Now we can get comps 1-2-6 at 102 from the constr. eqns on page 2:

$$\left.\begin{aligned} u_{102} &= u_{103} = 0.1 \\ v_{102} &= v_{103} - 110\,\theta_{z_{103}} = 0.397 - (110)(3.45 \times 10^{-3}) = .0175 \\ \theta_{z_{102}} &= \theta_{z_{103}} = 3.45 \times 10^{-3} \end{aligned}\right\} \tag{19}$$

Displacements

Grid	CID	T1	T2	T3	R1	R2	R3
101	0	0	0	0	0	0	0
102	0	0.1	.0175	0	0	0	.00345
103	0	0.1	.397	0	0	0	.00345

The MPC forces are

$$Q_{M_{MPC}} = H_{MN} U_N - \cancel{P_M}^{\,0} \tag{20}$$

$$Q_{N_{MPC}} = -G^T_{MN} Q_{M_{MPC}} \tag{21}$$

where

$$H_{MN} = K^T_{NM} + K_{MM} G_{MN}$$

from (1) and (8)

$$H_{MN} = 10^4 \left[\begin{array}{cc|c|cc} -1 & -6 & & 1 & \\ -1.2 & & 0 & 1.2 & -138 \\ 6 & 20 & & -6 & 700 \end{array}\right] \tag{22}$$

$$U_N = \left[\begin{array}{c} u_{101} \\ v_{101} \\ w_{101} \\ \theta_{x_{101}} \\ \theta_{y_{101}} \\ \theta_{z_{101}} \\ \hline w_{102} \\ \theta_{x_{102}} \\ \theta_{y_{102}} \\ \hline u_{103} \\ v_{103} \\ w_{103} \\ \theta_{x_{103}} \\ \theta_{y_{103}} \\ \theta_{z_{103}} \end{array}\right] = \left[\begin{array}{c} 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ \hline 0 \\ 0 \\ 0 \\ \hline 0.1 \\ .397 \\ 0 \\ 0 \\ 0 \\ .00345 \end{array}\right] \tag{23}$$

$$\therefore\ Q_{M_{MPC}} = \left\{\begin{array}{c} 0.1 \\ (1.2)(.397)-(138)(.00345) \\ (-6)(.397)+(700)(.00345) \end{array}\right\} 10^4 = \left\{\begin{array}{c} 1000 \\ 3 \\ 330 \end{array}\right\} \begin{array}{l} \text{on } 102\text{-}T1 \\ \text{on } 102\text{-}T2 \\ \text{on } 102\text{-}R3 \end{array} \tag{24}$$

and from G_{mm} in (1) with (21) and (24)

$$Q_{N_{MPC}} = -\begin{bmatrix} & & \\ & 0 & \\ & & \\ \hline & 0 & \\ \hline 1 & & \\ & 1 & \\ & & \\ & & \\ & & \\ -110 & & 1 \end{bmatrix} \begin{Bmatrix} 1000 \\ 3 \\ 330 \end{Bmatrix} = \begin{Bmatrix} 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ 0 \\ \hline 0 \\ 0 \\ 0 \\ \hline -1000 \\ -3 \\ 0 \\ 0 \\ 0 \\ 330-330=0 \end{Bmatrix} \begin{array}{l} \text{on 101 -T1} \\ \quad\quad\quad\

RBE2-01-CROD-03

RBE2-01-CROD-03

Example: Rod With Rigid Element And Enforced Displ. (Rigid Elem indep. DOF is an spc'd DOF)

All CROD's have $\left\{ \begin{array}{l} A = .01 \\ E = 10\times10^6 \\ \ell = 10 \end{array} \right\}$ so $\frac{AE}{\ell} = 10^4$

The eqns of motion are:

$$K_{gg} u_g = P_g + Q_g \quad \text{where } Q_g = R_{cg}^T q_c \tag{1}$$

$$R_{cg} u_g = Y_c \tag{2}$$

where q_c are generalized constraint forces, Y_c are constrained displ's for the c constraints

Since only motion (and stiffness) exist for the x direction, take

$$u_g = \left\{ \begin{array}{c} \left.\begin{array}{c} \left.\begin{array}{c} u_1 \\ u_2 \end{array}\right\} = u_f \\ \\ \end{array}\right\} u_n \\ \left.\begin{array}{c} u_3 \\ u_4 \end{array}\right\} = u_s \end{array} \right\} \tag{3}$$

The constraints are

$$\left.\begin{array}{l} u_2 = 0 \\ u_3 = 0.2 \\ u_4 = u_3 \end{array}\right\} \tag{4}$$

Put (4) in matrix form of (2)

$$\left[\begin{array}{c|cc|c} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ \hline 0 & 0 & 1 & -1 \end{array}\right] \begin{Bmatrix} u_1 \\ u_2 \\ u_3 \\ u_4 \end{Bmatrix} = \begin{Bmatrix} 0 \\ 0.2 \\ 0 \end{Bmatrix} \quad \text{i.e. } R_{cg} u_g = Y_c \tag{5}$$

Eqn (5) is of the form required for R_{cg}, namely:

$$\begin{bmatrix} 0_{sf} & I_{ss} & 0_{sm} \\ \underbrace{R_{mf} \quad R_{ms}}_{R_{mn}} & & R_{mm} \end{bmatrix} \begin{Bmatrix} u_f \\ u_s \\ u_m \end{Bmatrix} = \begin{Bmatrix} Y_s \\ 0_m \end{Bmatrix} \tag{6}$$

where

$$R_{mn} = [0 \quad 0 \quad 1] \tag{7}$$

$$R_{mm} = [-1] \tag{8}$$

So

$$G_{mn} = -R_{mm}^{-1} R_{mn} = \begin{array}{c} \begin{array}{ccc} u_1 & u_2 & u_3 \end{array} \\ \begin{bmatrix} 0 & 0 & 1 \end{bmatrix} \end{array} \tag{9}$$

The g-set stiffness, loads are:

$$K_{gg} = 10^4 \begin{array}{c} \begin{array}{cccc} u_1 & u_2 & u_3 & u_4 \end{array} \\ \left[\begin{array}{ccc|c} 2 & -1 & & -1 \\ -1 & 1 & & \\ & & 1 & -1 \\ \hline -1 & & -1 & 2 \end{array}\right] \end{array} \begin{array}{c} u_1 \\ u_2 \\ u_3 \\ u_4 \end{array} \qquad P_g = \begin{Bmatrix} 200 \\ 0 \\ 100 \\ \hline 300 \end{Bmatrix} \tag{10}$$

So that

$$\bar{K}_{nn} = 10^4 \begin{bmatrix} 2 & -1 & 0 \\ -1 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}, \quad K_{nm} = 10^4 \begin{bmatrix} -1 \\ 0 \\ -1 \end{bmatrix}, \quad K_{mm} = 2 \times 10^4, \quad \bar{P}_n = \begin{Bmatrix} 200 \\ 0 \\ 100 \end{Bmatrix}, \quad P_m = [300] \tag{11}$$

Then $$K_{nn} = \bar{K}_{nn} + (K_{nm}G_{mn}) + (K_{nm}G_{mn})^T + G_{mn}^T K_{mm} G_{mn}$$

where

$$K_{nm}G_{mn} = 10^4 \begin{bmatrix} -1 \\ 0 \\ -1 \end{bmatrix} \begin{bmatrix} 0 & 0 & 1 \end{bmatrix} = 10^4 \begin{bmatrix} 0 & 0 & -1 \\ 0 & 0 & 0 \\ 0 & 0 & -1 \end{bmatrix}$$

$$G_{mn}^T K_{mm} G_{mn} = 10^4 \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} \begin{bmatrix} 2 \end{bmatrix} \begin{bmatrix} 0 & 0 & 1 \end{bmatrix} = 10^4 \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 2 \end{bmatrix}$$

Thus

$$10^4 K_{nn} = \begin{bmatrix} 2 & -1 & 0 \\ -1 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} + \begin{bmatrix} 0 & 0 & -1 \\ 0 & 0 & 0 \\ 0 & 0 & -1 \end{bmatrix} + \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ -1 & 0 & -1 \end{bmatrix} + \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 2 \end{bmatrix}$$

$$\therefore \quad K_{nn} = 10^4 \begin{array}{c} \begin{array}{ccc} u_1 & u_2 & u_3 \end{array} \\ \begin{bmatrix} 2 & -1 & -1 \\ -1 & 1 & 0 \\ -1 & 0 & 1 \end{bmatrix} \end{array} \begin{array}{c} \\ u_1 \\ u_2 \\ u_3 \end{array} \qquad (12)$$

Also

$$P_n = \bar{P}_n + G_{mn}^T P_m = \begin{bmatrix} 200 \\ 0 \\ 100 \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} (200) = \begin{bmatrix} 200 \\ 0 \\ 400 \end{bmatrix} \qquad (13)$$

Partition in set into f, s sets

$$K_{nn} = 10^4 \left[\begin{array}{c|cc} 2 & -1 & -1 \\ \hline -1 & 1 & 0 \\ -1 & 0 & 1 \end{array}\right] = \begin{bmatrix} K_{ff} & K_{fs} \\ K_{fs}^T & K_{ss} \end{bmatrix} \tag{14}$$

So

$$K_{ff} = [2\times10^4] \;,\; K_{fs} = 10^4 \begin{bmatrix} -1 & -1 \end{bmatrix} \;,\; K_{ss} = 10^4 \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \tag{15}$$

Also

$$P_n = \left\{\begin{array}{c} 200 \\ \hline 0 \\ 400 \end{array}\right\} = \begin{Bmatrix} \bar{P}_f \\ P_s \end{Bmatrix} \tag{16}$$

So

$$\bar{P}_f = \{200\} \;,\; P_s = \begin{Bmatrix} 0 \\ 400 \end{Bmatrix} \tag{17}$$

Then

$$P_f = \bar{P}_f - K_{fs} Y_s = \{200\} - 10^4 \begin{bmatrix} -1 & -1 \end{bmatrix} \begin{Bmatrix} 0 \\ 0.2 \end{Bmatrix}$$

$$\therefore P_f = \{2{,}200\} \tag{18}$$

There is no o set so the f set eqns are the a set:

$$K_{ff} u_f = P_f \quad \text{or} \quad K_{aa} u_a = P_a \tag{19}$$

$$[2\times10^4] u_1 = 2{,}200$$

$$\therefore u_1 = 0.11 \quad (u_f) \tag{20}$$

Then

$$u_n = \begin{Bmatrix} u_f \\ u_s \end{Bmatrix} = \begin{Bmatrix} u_1 \\ \hline u_2 \\ u_3 \end{Bmatrix} = \begin{Bmatrix} 0.11 \\ 0 \\ 0.2 \end{Bmatrix} \tag{21}$$

and

$$u_g = \begin{Bmatrix} u_n \\ u_m \end{Bmatrix}$$

where u_m is DOF 4 and

$$u_4 = u_3$$

So

$$u_g = \begin{Bmatrix} u_1 \\ u_2 \\ u_3 \\ u_4 \end{Bmatrix} = \begin{Bmatrix} 0.11 \\ 0 \\ 0.2 \\ 0.2 \end{Bmatrix} \tag{22}$$

Now recover q_s:

$$q_s = K_{fs}^T u_f + K_{ss} Y_s - P_s \tag{23}$$

$$q_s = 10^4 \begin{bmatrix} -1 \\ -1 \end{bmatrix} \{0.11\} + 10^4 \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \begin{Bmatrix} 0 \\ 0.2 \end{Bmatrix} - \begin{Bmatrix} 0 \\ 400 \end{Bmatrix}$$

$$Q_{s_{SPC}} = q_s = \begin{Bmatrix} -1100 + 0 - 0 \\ -1100 + 2000 - 400 \end{Bmatrix} = \begin{Bmatrix} -1100 \\ 500 \end{Bmatrix} \begin{matrix} \text{on DOF 2} \\ \text{on DOF 3} \end{matrix} \tag{24}$$

(nodal forces due to SPC's on S-set DOF's)

and

$$Q_{g_{SPC}} = \begin{Bmatrix} \quad \\ -1100 \\ 500 \\ 0 \end{Bmatrix} \begin{matrix} \text{on DOF 1} \\ \text{" " 2} \\ \text{" " 3} \\ \text{" " 4} \end{matrix}$$

Now recover MPC forces:

$$Q_{m_{MPC}} = (K_{nm}^T + K_{mn}G_{mn})u_n - P_m$$

$$= \left(10^4\begin{bmatrix}-1 & 0 & -1\end{bmatrix} + 10^4\begin{bmatrix}2\end{bmatrix}\begin{bmatrix}0 & 0 & 1\end{bmatrix}\right)\begin{Bmatrix}0.11\\0\\0.2\end{Bmatrix} - 300$$

$$= 10^4\begin{bmatrix}-1 & 0 & 1\end{bmatrix}\begin{Bmatrix}0.11\\0\\0.2\end{Bmatrix} - 300$$

$$= 900 - 300$$

$$= 600 \quad \text{on m set DOF } u_4$$

and

$$Q_{n_{MPC}} = -G_{mn}^T Q_{m_{MPC}}$$

Use (9)

$$Q_{n_{MPC}} = -\begin{bmatrix}0\\0\\1\end{bmatrix}600 = \begin{Bmatrix}0\\0\\-600\end{Bmatrix}\begin{matrix}\text{DOF 1}\\ \text{" 2}\\ \text{" 3}\end{matrix} \quad \text{and} \quad Q_{g_{TMPC}} = \begin{Bmatrix}0\\0\\-600\\600\end{Bmatrix}\begin{matrix}\text{DOF 1}\\ \text{" 2}\\ \text{" 3}\\ \text{" 4}\end{matrix}$$

So the sum of constraint forces are:

$$Q_g = Q_{g_{SPC}} + Q_{g_{TMPC}} = \underbrace{\begin{Bmatrix}0\\-1100\\500\\0\end{Bmatrix}}_{\text{g-set SPC constraint forces}} + \underbrace{\begin{Bmatrix}0\\0\\-600\\600\end{Bmatrix}}_{\text{g-set MPC constraint forces}} = \begin{Bmatrix}0\\-1100\\-100\\600\end{Bmatrix}\begin{matrix}\text{DOF 1}\\ \text{" 2}\\ \text{" 3}\\ \text{" 4}\end{matrix}$$

Note also that Q_g could have been found from eqn (1) as

$$Q_g = K_{gg} u_g - P_g \tag{29}$$

where K_{gg} and P_g are in eqn 10 and u_g in eqn (22):

$$\therefore Q_g = \begin{Bmatrix} Q_1 \\ Q_2 \\ Q_3 \\ Q_4 \end{Bmatrix} = 10^4 \begin{bmatrix} 2 & -1 & 0 & -1 \\ -1 & 1 & 0 & 0 \\ 0 & 0 & 1 & -1 \\ -1 & 0 & -1 & 2 \end{bmatrix} \begin{Bmatrix} 0.11 \\ 0 \\ 0.2 \\ 0.2 \end{Bmatrix} - \begin{Bmatrix} 200 \\ 0 \\ 100 \\ 300 \end{Bmatrix}$$

$$= \begin{Bmatrix} 200 \\ -1100 \\ 0 \\ 900 \end{Bmatrix} - \begin{Bmatrix} 200 \\ 0 \\ 100 \\ 300 \end{Bmatrix} = \begin{Bmatrix} 0 \\ -1100 \\ -100 \\ 600 \end{Bmatrix} \begin{matrix} 1 \\ 2 \\ 3 \\ 4 \end{matrix} \tag{30}$$

which is the same as (28). Equilibrium of the applied and constraint forces is shown below:

Note also that this set of forces would result in $u_3 = u_4$ since there is no net force at G.P. 3 to cause strain in the element between G.P. 4 and G.P. 3 (which was stated to be rigid)

RBE2-01-CROD-05-MPC-03

RBE2-01-CROD-05-MPC-03

CRODS 12 → 56 have $\begin{cases} A = .01 \\ L = 10 \\ E = 10^7 \end{cases}$

NOTE: This makes $u_6 = 0$ since u_1 is SPC'd

Due to the RBE2 and MPC's, elems 23, 34, 45 are essentially rigid (i.e. the constr's will make displ's at both ends equal. Thus grids 2,3,4,5 will have same disp and grids 1,6 will have $u = 0$ ($u_6 = 0$ since it is MPC'd to u_1 which is SPC'd)

To calc the displ's of 2-5 consider the problem to be as if

$$k_T = \frac{2AE}{L} \text{ (CROD's 12, 56)} = \frac{(2)(.01)(10^7)}{10} = 2\times10^4$$

$$u_{2,3,4,5} = \frac{P_T}{k_T} = \frac{1400}{2\times10^4} = .07$$

The 2 CROD's, which have the same stiffness (i.e. $k_T/2$) will share the 1400 lb P_T equally so that engr force in CROD 12 and 56 will be 700 lb. The others will be 0 since they are rigid (due to RBE2 or MPC)

The SPC and MPC forces can be determined logically as shown on next page

Since the only SPC is $u_1 = 0$ then $Q_{s_1} = -(P_2 + P_3 + P_4 + P_5) = -1400$ (non redundant)

This leaves us with the following free body diagram

The remainder of the forces needed <u>to put each grid in force balance</u> are <u>MPC forces</u> so that, looking at each grid:

So the MPC forces are

$$Q_{MPC_1} = 700$$
$$Q_{MPC_2} = 500$$
$$Q_{MPC_3} = -300$$
$$Q_{MPC_4} = -400$$
$$Q_{MPC_5} = 200$$
$$Q_{MPC_6} = -700$$

(1)

(since no elements connect to u_m (grid 999) there are no terms in K_{NN} or K_{mm} and eqn (1) are the only nonzero terms in K_{GG}. The N set consists of grids 100, 101 and the M set is grid 99.

The G set load vector, P_G, only has terms for the M set (no applied loads on the N set):

$$P_G = \begin{Bmatrix} \bar{P}_N \\ P_M \end{Bmatrix} \qquad \bar{P}_N = 0 \text{ no applied loads on the N set} \tag{2}$$

$$P_M = \begin{array}{c} \begin{array}{cc} s/c\ 1 & s/c\ 2 \end{array} \\ \begin{bmatrix} 0 & 0 \\ 1000 & 0 \\ 0 & 1000 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \end{array} \tag{3}$$

The constraint eqns are

$$R_{MG} u_G = 0 \quad \text{or} \quad \begin{bmatrix} R_{MN} & R_{MM} \end{bmatrix} \begin{Bmatrix} u_N \\ u_M \end{Bmatrix} = 0 \tag{4}$$

where

$$R_{MG} = \begin{array}{c} \begin{array}{cccccc|cccccc|cccccc} \overbrace{1\ 2\ 3\ 4\ 5\ 6}^{100} & & & & & & \overbrace{1\ 2\ 3\ 4\ 5\ 6}^{101} & & & & & & \overbrace{1\ 2\ 3\ 4\ 5\ 6}^{999} & & & & & \end{array} \\ \left[\begin{array}{cccccc|cccccc|ccc|ccc} -1 & & & & & & & & & & & & 1 & & & & -4 & 3 \\ & -1 & & & & & & & & & & & & 1 & & 4 & & -3 \\ & & -1 & & & & & & 0 & & & & & & 1 & -3 & 3 & \\ & -4 & 3 & & & & & & & & & & & 4 & -3 & 25 & & \\ 4 & & -3 & & & & & & & & & & -4 & & 3 & & 25 & \\ -3 & 3 & & & & & & & & & & & 3 & -3 & & & & 18 \end{array}\right] \\ \underbrace{\qquad\qquad\qquad\qquad}_{R_{MN}} \qquad \underbrace{\qquad\qquad\qquad\qquad}_{R_{MM}} \end{array} \tag{5}$$

(see attached Appd for details)

Solving (4) for u_M in terms of u_N we get:

$$u_M = \underbrace{-R_{MM}^{-1} R_{MN}}_{G_{MN}} u_N \tag{6}$$

Using G_{MN} from MYSTRAN (see check on G_{MN} in App A):

$$G_{MN} = \begin{array}{c} \begin{array}{cccccc} \overbrace{1\ \ 2\ \ 3\ \ 4\ \ 5\ \ 6}^{100} & \overbrace{1\ \ 2\ \ 3\ \ 4\ \ 5\ \ 6}^{101} \end{array} \\ \left[\begin{array}{ccc|ccc|ccc|ccc} 1 & & & & & & & & & & & \\ & 1 & & & 0 & & & 0 & & & 0 & \\ & & 1 & & & & & & & & & \\ \hline & & & & & & & & & & & \\ & 0 & & & 0 & & & 0 & & & 0 & \\ & & & & & & & & & & & \\ \hline & & & & & & & & & & & \\ & 0 & & & 0 & & & 0 & & & 0 & \\ & & & & & & & & & & & \\ \hline & & & & & & & & & & & \\ & 0 & & & 0 & & & 0 & & & 0 & \\ & & & & & & & & & & & \end{array}\right] \end{array} \begin{array}{c} 999\text{-}1 \\ \text{-}2 \\ \text{-}3 \\ \text{-}4 \\ \text{-}5 \\ \text{-}6 \end{array} \qquad (7)$$

The reduced loads on the N set are

$$P_N = \bar{P}_N + G_{MN}^T P_M \qquad (\bar{P}_N = 0 \text{ in this prob})$$

$$P_N = \underbrace{\left[\begin{array}{ccc|ccc|ccc|ccc} 1 & & & & & & & & & & & \\ & 1 & & & 0 & & & & & & & \\ & & 1 & & & & & & & & & \\ \hline & & & & & & & & & & & \\ & 0 & & & 0 & & & & & & & \\ & & & & & & & & & & & \\ \hline & & & & & & & & & & & \\ & 0 & & & 0 & & & & & & & \\ & & & & & & & & & & & \\ \hline & & & & & & & & & & & \\ & 0 & & & 0 & & & & & & & \\ & & & & & & & & & & & \end{array}\right]}_{G_{MN}} \underbrace{\begin{bmatrix} 0 & 0 \\ 1000 & 0 \\ 0 & 1000 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \end{bmatrix}}_{P_M \text{ loads on grid } 999} = \underbrace{\begin{array}{cc} \text{s/c 1} & \text{s/c 2} \\ \begin{bmatrix} 0 & 0 \\ 1000 & 0 \\ 0 & 1000 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \end{array}}_{P_N \text{ loads on grid } 100} \qquad (8)$$

From here on the soln for displs is:

$$K_{NN} u_N = P_N \qquad (9)$$

and is not solved here since it is standard MYSTRAN stuff. However, we will go through the calculation of constraint forces.

From MYSTRAN the displs are

$$
u_G = \begin{array}{c}
\begin{array}{cc} \text{s/c 1} & \text{s/c 2} \end{array} \\
\left[\begin{array}{c|c}
0 & 0 \\
2.666667\times10^{-3} & 0 \\
0 & 5.\times10^{-4} \\
-1.0\times10^{-3} & 0 \\
0 & 0 \\
0 & 0 \\
\hline
0 & 0 \\
0 & 0 \\
0 & 0 \\
0 & 0 \\
0 & 0 \\
0 & 0 \\
\hline
0 & 0 \\
2.666667\times10^{-3} & 0 \\
0 & 5\times10^{-4} \\
0 & 0 \\
0 & 0 \\
0 & 0
\end{array}\right]
\end{array}
\begin{array}{l}
100\text{-}1 \\ \text{-}2 \\ \text{-}3 \\ \text{-}4 \\ \text{-}5 \\ \text{-}6 \\
101\text{-}1 \\ \text{-}2 \\ \text{-}3 \\ \text{-}4 \\ \text{-}5 \\ \text{-}6 \\
999\text{-}1 \\ \text{-}2 \\ \text{-}3 \\ \text{-}4 \\ \text{-}5 \\ \text{-}6
\end{array}
\begin{array}{l}
\left.\vphantom{\begin{array}{c}0\\0\\0\\0\\0\\0\end{array}}\right\} u_F \\
\left.\vphantom{\begin{array}{c}0\\0\\0\\0\\0\\0\end{array}}\right\} u_S \\
\left.\vphantom{\begin{array}{c}0\\0\\0\\0\\0\\0\end{array}}\right\} u_M
\end{array}
\qquad (10)
$$

The SPC forces are

$$Q_{s_{spc}} = K_{FS}^T u_F + K_{SS}\cancel{Y_s}^{\,0} - \cancel{P_s}^{\,0} \quad \text{on } u_s \text{ DOF}$$

K_{FS}^T is the 6×6 lower left partition in (1) and u_F is the upper 6×2 partition in (10):

$$
Q_{s_{spc}} = 10^5 \begin{array}{c|cccccc}
 & \multicolumn{6}{c}{\overbrace{\hspace{6em}}^{100}} \\
 & 1 & 2 & 3 & 4 & 5 & 6 \\
\hline
101\text{-}1 & -15 & & & & 30 & \\
\text{-}2 & & -15 & & -30 & & \\
\text{-}3 & & & -20 & & & \\
\text{-}4 & & 30 & & 40 & & \\
\text{-}5 & -30 & & & & 40 & \\
\text{-}6 & & & & & & -8
\end{array}
\begin{array}{cc}
\text{s/c 1} & \text{s/c 2} \\
\left[\begin{array}{c|c}
0 & 0 \\
2.666667\times10^{-3} & 0 \\
0 & 5.\times10^{-4} \\
-1.\times10^{-3} & 0 \\
0 & 0 \\
0 & 0
\end{array}\right]
\end{array}
=
\begin{array}{cc}
\text{s/c 1} & \text{s/c 2} \\
\left[\begin{array}{c|c}
0 & 0 \\
-1000 & 0 \\
0 & -1000 \\
0 & 0 \\
0 & 0 \\
0 & 0
\end{array}\right]
\end{array}
\begin{array}{l}
101\text{-}1 \\ \text{-}2 \\ \text{-}3 \\ \text{-}4 \\ \text{-}5 \\ \text{-}6
\end{array}
$$

Same Q_s as MYSTRAN

(11)

The MPC forces are (on N, M sets)

$$Q_{G_{MPC}} = \begin{bmatrix} -G_{MN}^T \\ I_{MM} \end{bmatrix} \left[(\cancel{K_{NM}^T}^{\,0} + \cancel{K_{MM}}^{\,0} G_{MN}) u_N - P_M \right] \quad \text{on G-set} \qquad (12)$$

for this prob.

$$= \begin{bmatrix} G_{NN}^T P_M \\ -P_M \end{bmatrix} \begin{matrix} \text{MPC forces on N set (grids 100, 101} \\ \text{MPC forces on M set (grid 999)} \end{matrix} \qquad (13)$$

from top of (13)

$$Q_{N_{MPC}} = G_{MN}^T P_M = \begin{bmatrix} 1 & & & & & \\ & 1 & & & 0 & \\ & & 1 & & & \\ & 0 & & & 0 & \\ & & & & & \\ & 0 & & & 0 & \\ & & & & & \\ & 0 & & & 0 & \end{bmatrix} \begin{array}{c} \begin{array}{cc} \text{s/c 1} & \text{s/c 2} \end{array} \\ \begin{bmatrix} 0 & 0 \\ 1000 & 0 \\ 0 & 1000 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \end{array} = \begin{array}{c} \begin{array}{cc} \text{s/c 1} & \text{s/c 2} \end{array} \\ \begin{bmatrix} 0 & 0 \\ 1000 & 0 \\ 0 & 1000 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \end{array} \begin{array}{r} 100-1 \\ -2 \\ -3 \\ -4 \\ -5 \\ -6 \\ 101-1 \\ -2 \\ -3 \\ -4 \\ -5 \\ -6 \end{array}$$

MPC forces on grids 100, 101
(same as MYSTRAN

from bottom of (13)

$$Q_{M_{MPC}} = -P_M = \begin{bmatrix} 0 & 0 \\ -1000 & 0 \\ 0 & -1000 \\ 0 & 0 \\ 0 & 0 \\ 0 & 0 \end{bmatrix} \begin{array}{r} 999-1 \\ -2 \\ -3 \\ -4 \\ -5 \\ -6 \end{array}$$

MPC forces on grid 999
(same as MYSTRAN

Appendix A

(for CBAR_RBE3_3)

The constraint eqns on $u_{x_A}, u_{y_A}, u_{z_A}, \theta_{x_A}, \theta_{y_A}, \theta_{y_z}$ are summarized below.

$$u_{x_A} - \bar{d}_z \theta_{y_A} + \bar{d}_y \theta_{z_A} - \frac{1}{W_T} \sum^N \omega_i u_{x_i} = 0$$

$$u_{y_A} + \bar{d}_z \theta_{x_A} - \bar{d}_x \theta_{z_A} - \frac{1}{W_T} \sum^N \omega_i u_{y_i} = 0$$

$$u_{z_A} - \bar{d}_y \theta_{x_A} + \bar{d}_x \theta_{y_A} - \frac{1}{W_T} \sum \omega_i u_{z_i} = 0$$

$$\bar{e}_{yz} \theta_{x_A} + W_T \bar{d}_z u_{y_A} - W_T \bar{d}_y u_{z_A} - \sum^N \omega_i d_{z_i} u_{y_i} + \sum^N \omega_i d_{y_i} u_{z_i} = 0$$

$$\bar{e}_{zx} \theta_{y_A} - W_T \bar{d}_z u_{x_A} + W_T \bar{d}_x u_{z_A} + \sum^N \omega_i d_{z_i} u_{x_i} - \sum^N \omega_i d_{x_i} u_{z_i} = 0$$

$$\bar{e}_{xy} \theta_{z_A} + W_T \bar{d}_y u_{x_A} - W_T \bar{d}_x u_{y_A} - \sum^N \omega_i d_{y_i} u_{x_i} + \sum^N \omega_i d_{x_i} u_{y_i} = 0$$

where

a) $W_T = \sum^N \omega_i$, $\bar{e}_{xy} = \sum^N \omega_i (d_{x_i}^2 + d_{y_i}^2)$, $\bar{e}_{yz} = \sum^N \omega_i (d_{y_i}^2 + d_{z_i}^2)$, $\bar{e}_{zx} = \sum^N \omega_i (d_{z_i}^2 + d_{x_i}^2)$

b) $\bar{d}_x = \sum^N \omega_i d_{x_i}$, $\bar{d}_y = \sum^N \omega_i d_{y_i}$, $\bar{d}_z = \sum^N \omega_i d_{z_i}$

c) $d_{x_i}, d_{y_i}, d_{z_i}$ are the coords of pt i <u>relative</u> to pt A in the global coord. sys at A

d) $u_{x_i}, u_{y_i}, u_{z_i}$ are displ's at i transformed from global coord sys. at i to global coord sys at A

e) $u_{x_A}, u_{y_A}, u_{z_A}, \theta_{x_A}, \theta_{y_A}, \theta_{z_A}$ are displ's at A in the global coord. sys. at A (obviously)

f) The weights ω_i are assigned by the user (and are often 1.0)

The RBE3 connection entry in CBAR_RBE3_3.DAT is

1	2	3	4	5	6	7	8	9
RBE3	9999		999	123456	1.	123	100	
	EID		pt A	Comp's at A		Comp's at i	pt i = 1	

Using the eqns on the prev pg and the data for the prob CBAR_RBE3-3 (with 1 "indep" pt)

$$W_T = \sum \omega_i = 1$$

$$\bar{d}_x = 3, \ \bar{d}_y = 3, \ \bar{d}_z = 4$$

$$d_{x_i} = 3, \ d_{y_i} = 3, \ d_{z_i} = 4$$

$$\bar{e}_{xy} = 3^2 + 3^2 = 18$$

$$\bar{e}_{yz} = 3^2 + 4^2 = 25$$

$$\bar{e}_{zx} = 4^2 + 3^2 = 25$$

So the 6 constraint eqns are (A = 999):

$$\left.\begin{aligned}
u_{x_A} - 4\theta_{y_A} + 3\theta_{z_A} - u_{x_{100}} &= 0 \\
u_{y_A} + 4\theta_{x_A} - 3\theta_{z_A} - u_{y_{100}} &= 0 \\
u_{z_A} - 3\theta_{x_A} + 3\theta_{y_A} - u_{z_{100}} &= 0
\end{aligned}\right\} \text{coeffs for RMG matrix}$$

$$\left.\begin{aligned}
25\theta_{x_A} + 4u_{y_A} - 3u_{z_A} - 4u_{y_{100}} + 3u_{z_{100}} &= 0 \\
25\theta_{y_A} - 4u_{x_A} + 3u_{z_A} + 4u_{x_{100}} - 3u_{z_{100}} &= 0 \\
18\theta_{z_A} + 3u_{x_A} - 3u_{y_A} - 3u_{x_{100}} + 3u_{y_{100}} &= 0
\end{aligned}\right\}$$

which is the same as eqn (5) in the main derivation of sol'n for CBAR_RBE3_3.

Therefore RMG is correct

As a check on G_{MN} in eqns (6), (7) in the main part of this example notice that

$$G_{MN} = -R_{MM}^{-1} R_{MN}$$

so that

$$R_{MM} G_{MN} = -R_{MN}$$

where R_{MM} is in eqn (5) and G_{MN} in eqn (7) so:

$$R_{MM} G_{MN} = \left[\begin{array}{ccc|ccc} 1 & & & & -4 & 3 \\ & 1 & & 4 & & -3 \\ & & 1 & -3 & 3 & \\ \hline & 4 & -3 & 25 & & \\ -4 & & 3 & & 25 & \\ 3 & -3 & & & & 18 \end{array}\right] \left[\begin{array}{ccc|c|c|c} 1 & & & & & \\ & 1 & & 0 & 0 & 0 \\ & & 1 & & & \\ \hline & & & & & \\ & 0 & & 0 & 0 & 0 \\ & & & & & \end{array}\right]$$

$$= \left[\begin{array}{ccc|c|c|c} 1 & & & & & \\ & 1 & & 0 & 0 & 0 \\ & & 1 & & & \\ \hline & 4 & -3 & & & \\ -4 & & 3 & 0 & 0 & 0 \\ 3 & -3 & & & & \end{array}\right]$$

which is the neg of the R_{MN} partition in eqn (5)

$\bar{P}_f$

P_s

$$K_{ff} u_f = P_f$$

$$P_f = \bar{P}_f - K_{fs} u_s = \bar{P}_f - K_{fs_e} Y_{s_e}$$

where

$$K_{ff} = 10^5 \begin{array}{c} \begin{bmatrix} 1 & -1 & & \\ -1 & 3 & & \\ & & 11 & -5 \\ & & -5 & 9 \end{bmatrix} \end{array} \begin{array}{l} 701\text{-}1 \\ 601\text{-}1 \\ 201\text{-}1 \\ 301\text{-}1 \end{array}$$

K_{fs_e} is the partition from K_{fs} for the col's associated with the enforced displ DOF's (501-TX, 401-TX):

$$K_{fs_e} = 10^5 \begin{array}{c} \begin{array}{cc} 501\text{-}1 & 401\text{-}1 \end{array} \\ \begin{bmatrix} 0 & 0 \\ -2 & 0 \\ 0 & 0 \\ 0 & -4 \end{bmatrix} \end{array}, \quad Y_{s_e} = \begin{Bmatrix} .006 \\ .008 \end{Bmatrix} \begin{array}{l} 501\text{-}1 \\ 401\text{-}1 \end{array}$$

$$\therefore K_{fs_e} Y_{s_e} = 10^5 \begin{bmatrix} 0 & 0 \\ -2 & 0 \\ 0 & 0 \\ 0 & -4 \end{bmatrix} \begin{Bmatrix} .006 \\ .008 \end{Bmatrix} = \begin{Bmatrix} 0 \\ -1200 \\ 0 \\ -3200 \end{Bmatrix} \begin{array}{l} 701\text{-}1 \\ 601\text{-}1 \\ 201\text{-}1 \\ 301\text{-}1 \end{array} \quad (= PFYS)$$

$$\bar{P}_f = \underbrace{\begin{array}{c} \begin{array}{cc} S/C\ 1 & S/C\ 2 \end{array} \\ \begin{bmatrix} 120 & 0 \\ 100 & 0 \\ 0 & 240 \\ 0 & 150 \end{bmatrix} \end{array}}_{\text{RODLOAD-W-LOAD (2 subcases)}} \begin{array}{l} 701\text{-}1 \\ 601\text{-}1 \\ 201\text{-}1 \\ 301\text{-}1 \end{array}, \quad \bar{P}_f = \underbrace{\begin{Bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{Bmatrix}}_{\text{RODLOAD-N-LOAD (1 subcase)}}$$

$$\therefore P_f = \underbrace{\begin{bmatrix} 120 & 0 \\ 1300 & 1200 \\ 0 & 240 \\ 3200 & 3350 \end{bmatrix}}_{\text{RODLOAD-W-LOAD (2 subcases)}}, \quad P_F = \underbrace{\begin{Bmatrix} 0 \\ 1200 \\ 0 \\ 3200 \end{Bmatrix}}_{\text{RODLOAD-N-LOAD (1 subcase)}} \begin{array}{l} 701\text{-}1 \\ 601\text{-}1 \\ 201\text{-}1 \\ 301\text{-}1 \end{array}$$

Since there are no OMIT's, the F-set is also the A-set

$$K_{aa} = 10^5 \begin{bmatrix} 1 & -1 & & \\ -1 & 3 & & \\ & & 11 & -5 \\ & & -5 & 9 \end{bmatrix}, \quad P_a = \begin{array}{c} \begin{array}{cc} s/c\,1 & s/c\,2 \end{array} \\ \begin{Bmatrix} 120 & 0 \\ 1300 & 1200 \\ 0 & 240 \\ 3200 & 3350 \end{Bmatrix} \end{array}$$

Note

$$K_{aa} = \begin{bmatrix} K_{11} & \theta \\ \theta & K_{22} \end{bmatrix}, \quad K_{11} = 10^5 \begin{bmatrix} 1 & -1 \\ -1 & 3 \end{bmatrix}, \quad K_{22} = 10^5 \begin{bmatrix} 11 & -5 \\ -5 & 9 \end{bmatrix}$$

So

$$K_{aa}^{-1} = \begin{bmatrix} K_{11}^{-1} & \theta \\ \theta & K_{22}^{-1} \end{bmatrix}, \quad K_{11}^{-1} = 10^{-5} \begin{bmatrix} 1.5 & 0.5 \\ 0.5 & 0.5 \end{bmatrix}, \quad K_{22}^{-1} = 10^{-5} \begin{bmatrix} 9/74 & 5/74 \\ 5/74 & 11/74 \end{bmatrix}$$

$$\therefore \; u_a = K_{aa}^{-1} P_a = 10^{-5} \begin{bmatrix} 1.5 & 0.5 & & \\ 0.5 & 0.5 & & \\ & & 9/74 & 5/74 \\ & & 5/74 & 11/74 \end{bmatrix} \underbrace{\begin{Bmatrix} 120 & 0 \\ 1300 & 1200 \\ 0 & 240 \\ 3200 & 3350 \end{Bmatrix}}_{\text{RODLOAD-W-LOAD (2 SUBCASES)}} \text{ and } \underbrace{\begin{Bmatrix} 0 \\ 1200 \\ 0 \\ 3200 \end{Bmatrix}}_{\text{RODLOAD-N-LOAD (1 SUBCASE)}}$$

$$u_a = u_f = \begin{array}{r} 201\text{-}1 \\ 601\text{-}1 \\ 201\text{-}1 \\ 301\text{-}1 \end{array} \begin{Bmatrix} 8.300000 \times 10^{-3} & 6.000000 \times 10^{-3} \\ 7.100000 \times 10^{-3} & 6.000000 \times 10^{-3} \\ 2.162162 \times 10^{-3} & 2.555405 \times 10^{-3} \\ 4.756757 \times 10^{-3} & 5.141892 \times 10^{-3} \end{Bmatrix} \text{ and } \begin{Bmatrix} 6.000000 \times 10^{-3} \\ 6.000000 \times 10^{-3} \\ 2.162162 \times 10^{-3} \\ 4.756757 \times 10^{-3} \end{Bmatrix}$$

Merge in Y_{se} and sort to get u_g:

$$u_g = \begin{array}{r} 101\text{-}1 \\ 201\text{-}1 \\ 301\text{-}1 \\ 401\text{-}1 \\ 501\text{-}1 \\ 601\text{-}1 \\ 701\text{-}1 \end{array} \underbrace{\begin{array}{c} \begin{array}{cc} s/c\,1 & s/c\,2 \end{array} \\ \begin{Bmatrix} 0. & 0. \\ 2.162162 \times 10^{-3} & 2.555405 \times 10^{-3} \\ 4.756757 \times 10^{-3} & 5.141892 \times 10^{-3} \\ 8.000000 \times 10^{-3} & 8.000000 \times 10^{-3} \\ 6.000000 \times 10^{-3} & 6.000000 \times 10^{-3} \\ 7.100000 \times 10^{-3} & 6.000000 \times 10^{-3} \\ 8.300000 \times 10^{-3} & 6.000000 \times 10^{-3} \end{Bmatrix} \end{array}}_{\text{RODDISPL-W-LOAD}} \text{ and } \underbrace{\begin{Bmatrix} 0. \\ 2.162162 \times 10^{-3} \\ 4.756757 \times 10^{-3} \\ 8.000000 \times 10^{-3} \\ 6.000000 \times 10^{-3} \\ 6.000000 \times 10^{-3} \\ 6.000000 \times 10^{-3} \end{Bmatrix}}_{\text{RODDISPL-N-LOAD}}$$

Constraint Forces: $Q_s = K_{fs}^T u_f + K_{ss_e} Y_{s_e} - P_s$

$K_{ff} u_f = 10^5$

RODLOAD-MPC-FOR-SING

RODLOAD-MPC-FOR-SING

Rod with MPC to Remove Singularity

G.P. 101 Global = 0

G.P. 102 Global = 12

G.P. 102 has Coord Sys 12 as Global

$\cos\theta = .923880$

$\sin\theta = .382683$

$A = 0.1,\ E = 10^7 :\ \frac{AE}{l} = 10^4$

Elem K_e:

$$K_e = \begin{array}{cc} \begin{bmatrix} 10^4 & -10^4 \\ -10^4 & 10^4 \end{bmatrix} & \begin{matrix} u_a \\ u_b \end{matrix} \end{array} \qquad \begin{matrix} u_a = u_{101} \\ u_b = \cos\theta\, u_{102} - \sin\theta\, v_{102} \end{matrix}$$

$$\begin{Bmatrix} u_a \\ u_b \end{Bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos\theta & -\sin\theta \end{bmatrix} \begin{Bmatrix} u^0_{101} \\ u^{12}_{102} \\ v^{12}_{102} \end{Bmatrix} \quad \text{or} \quad u_e = T_e u_g$$

The global K for dof's $u_{101}, u_{102}, v_{102}$ is

$$K_{gg} = T_e^T K_e T_e$$

$$= 10^4 \begin{bmatrix} 1 & 0 \\ 0 & c \\ 0 & -s \end{bmatrix} \begin{bmatrix} 1 & -1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & c & -s \end{bmatrix} \qquad \begin{matrix} c = \cos\theta = .923880 \\ s = \sin\theta = .382683 \end{matrix}$$

(nonzero terms in:) $$K_{gg} = 10^4 \left[\begin{array}{cc|c} 1 & -c & s \\ -c & c^2 & -sc \\ \hline s & -sc & s^2 \end{array}\right] = 10^4 \left[\begin{array}{cc|c} 1 & -.923880 & .382683 \\ -.923880 & .853553 & -.353553 \\ \hline .382683 & -.353553 & .146447 \end{array}\right] \begin{matrix} u^0_{101} \\ u^{12}_{102} \\ v^{12}_{102} \end{matrix}$$

In order to remove the singularity in the Y_0 direction, use MPC:

$$\sin\theta\, u^{12}_{102} + \cos\theta\, v^{12}_{102} = 0$$

So

$$\left[\underbrace{\begin{matrix} 0 & s \end{matrix}}_{R_{mn}} \;\vdots\; \underbrace{c}_{R_{mm}}\right] \begin{Bmatrix} u^0_{101} \\ u^{12}_{102} \\ v^{12}_{102} \end{Bmatrix} = 0$$

$$\left[\begin{matrix} 0 & .382683 & .923880 \end{matrix}\right] \begin{Bmatrix} u^0_{101} \\ u^{12}_{102} \\ v^{12}_{102} \end{Bmatrix} = 0$$

Then

$$G_{mn} = -R_{mm}^{-1} R_{mn} \qquad u_n = \begin{Bmatrix} u^0_{101} \\ u^{12}_{102} \end{Bmatrix}, \; u_m = v^{12}_{102}$$

$$= -\frac{1}{c}\begin{bmatrix} 0 & s \end{bmatrix} = \begin{bmatrix} 0 & -t \end{bmatrix} \qquad t = \frac{s}{c} = \tan\theta = .414213562$$

$$= \begin{bmatrix} 0 & -.414213 \end{bmatrix}$$

Reduce to m set:

$$K_{nn} = \bar{K}_{nn} + K_{nm}G_{mn} + (K_{nm}G_{mn})^T + G_{mn}^T K_{mm} G_{mn}$$

$$\bar{K}_{nn} = 10^4 \begin{bmatrix} 1 & -c \\ -c & c^2 \end{bmatrix} = 10^4 \begin{bmatrix} 1 & -.923880 \\ -.923880 & .853553 \end{bmatrix}$$

$$K_{nm}G_{mn} = 10^4 \begin{bmatrix} s \\ -sc \end{bmatrix} \begin{bmatrix} 0 & -t \end{bmatrix} = 10^4 \begin{bmatrix} 0 & -st \\ 0 & sct \end{bmatrix}$$

$$= 10^4 \begin{bmatrix} .382683 \\ -.353553 \end{bmatrix} \begin{bmatrix} 0 & -.414214 \end{bmatrix} = 10^4 \begin{bmatrix} 0 & -.158513 \\ 0 & .146446 \end{bmatrix} \checkmark$$

$$G_{mn}^T K_{mm} G_{mn} = 10^4 \begin{bmatrix} 0 \\ -.414214 \end{bmatrix} \begin{bmatrix} .146447 \end{bmatrix} \begin{bmatrix} 0 & -.414214 \end{bmatrix}$$

$$= 10^4 \begin{bmatrix} 0 & 0 \\ 0 & .0251263 \end{bmatrix}$$

So

$$K_{nn} = 10^4 \left\{ \begin{bmatrix} 1 & -.923880 \\ -.923880 & .853553 \end{bmatrix} + \begin{bmatrix} 0 & -.158513 \\ 0 & .146446 \end{bmatrix} + \begin{bmatrix} 0 & 0 \\ -.158513 & .146446 \end{bmatrix} + \begin{bmatrix} 0 & 0 \\ 0 & .0251263 \end{bmatrix} \right\}$$

$$= 10^4 \begin{bmatrix} 1 & -1.08239 \\ -1.08239 & 1.17187 \end{bmatrix} \checkmark \qquad \begin{matrix} u^0_{101} \\ u^{12}_{102} \end{matrix}$$

The loads are

$P = 100$ lb in X_0 direction at G.P. 102

or

$$P_g = \begin{Bmatrix} 0 \\ 100\cos\theta \\ -100\sin\theta \end{Bmatrix} \begin{matrix} u^0_{101} \\ u^{12}_{102} \\ v^{12}_{102} \end{matrix}$$

$$\therefore P_g = \begin{Bmatrix} 0 \\ 92.388 \\ -38.2683 \end{Bmatrix} \checkmark = \begin{Bmatrix} \bar{P}_n \\ P_m \end{Bmatrix}$$

$$P_n = \bar{P}_n + G_{mn}^{\uparrow} P_m = \begin{Bmatrix} 0 \\ 92.388 \end{Bmatrix} + \begin{Bmatrix} 0 \\ -.414214 \end{Bmatrix} \{-38.2683\}$$

$$P_n = \begin{Bmatrix} 0 \\ 108.239 \end{Bmatrix} \checkmark$$

So

$$K_{nn} u_n = P_n + Q_n = 10^4 \left[\begin{array}{c|c} 1 & -1.08239 \\ \hline -1.08239 & 1.17517 \end{array}\right] \left\{\begin{array}{c} u^0_{101} \\ \hline u^{12}_{102} \end{array}\right\} = \left\{\begin{array}{c} 0 \\ \hline 108.239 \end{array}\right\} + \left\{\begin{array}{c} 0 \\ Q_s \end{array}\right\}$$

$$= \begin{bmatrix} K_{ff} & K_{fs} \\ K_{fs} & K_{ss} \end{bmatrix} \begin{Bmatrix} u_f \\ u_s \end{Bmatrix} = \begin{Bmatrix} \bar{P}_n \\ P_m \end{Bmatrix} + \begin{Bmatrix} 0 \\ Q_s \end{Bmatrix}$$

Now $u^0_{101} = 0$ so

$$u^{12}_{102} = \frac{108.239}{1.17517 \times 10^4} = 9.2388 \times 10^{-3} \checkmark$$

and

$$v^{12}_{102} = -\frac{s}{c} u^{12}_{102} = -\frac{.382683}{.923880}\left(9.23880 \times 10^{-3}\right) = -3.82683 \times 10^{-3} \checkmark$$

$$u_f = u^{12}_{102}$$

The SPC forces are

$$Q_s = K_{fs}^T u_f + K_{ss}\cancel{u_s}^{\,0} - \cancel{P_s}^{\,0} = 10^4(-1.08239)(9.23880\times10^{-3}) = 100\ \text{lb at } u_{101}\ \text{dof}$$

The MPC forces are

$$Q_m = K_{nm}^T u_n + K_{mm}u_m - P_m \qquad u_n = \begin{Bmatrix} u_{101} \\ u_{102} \end{Bmatrix} = \begin{Bmatrix} 0 \\ 9.2388\times10^{-3} \end{Bmatrix}$$

$$= 10^4 \begin{bmatrix} .382683 \\ -.353553 \end{bmatrix}^T \begin{Bmatrix} 0 \\ 9.2388\times10^{-3} \end{Bmatrix} + 10^4(.146447)(-3.82683\times10^{-3}) + (38.2683)\Big\}$$

$$= \Big\{-32.6641 - 5.6043 + 38.2683\Big\} = \cancel{-.0001}^{\,0}$$

Note also that the displ. in the x_0 direction could have been calculated simply from

$$u_{102}^0 = \frac{PL}{AE} = \frac{(100)(100)}{(.1)(10^7)} = .01 =$$

Then

$$u_{102}^{12} = u_{102}^0 \cos\theta = (.01)(.923880) = 9.2388\times10^{-3}$$

SOLVE_EQNS_1

$$k_e = \frac{A_e E_e}{l_e}\begin{bmatrix} 1 & -1 \\ -1 & 1 \end{bmatrix} = \begin{bmatrix} 10A_e & -10A_e \\ -10A_e & 10A_e \end{bmatrix}$$

$$K = \begin{array}{c} \begin{array}{cccccc} 105 & 103 & 101 & 102 & 104 & 106 \end{array} \\ \begin{bmatrix} 5. & & & & -3. & -2. \\ & 9. & & -5. & -4. & \\ & & 6. & -6 & & \\ & -5 & -6 & 11. & & \\ -3. & -4. & & & 7. & \\ -2. & & & & & 3. \end{bmatrix} \end{array} \begin{array}{c} 105 \\ 103 \\ 101 \\ 102 \\ 104 \\ 106 \end{array}, \quad u = \begin{bmatrix} u_{105} \\ u_{103} \\ u_{101} \\ u_{102} \\ u_{104} \\ u_{106} \end{bmatrix}, \quad P = \begin{bmatrix} 5. \\ 3. \\ 1. \\ 2. \\ 4. \\ 6. \end{bmatrix}$$

Solve

$$Ku = P \tag{1}$$

Factor K into $U^T D^{-1} U$

$$U^T D^{-1} U u = P \tag{2}$$

Let

$$Uu = y \tag{3}$$

Then, from (2) and (3)

$$U^T D^{-1} y = P \tag{4}$$

Solve (4) for y in "forward pass", then solve (3) for u in "backward pass"

Method 1: Do Not Equilibrate K:

Triangularize K

Original K

$$\begin{bmatrix} 5. & & & & -3 & -2. \\ & 9. & & -5 & -4 & \\ & & 6 & -6 & & \\ & -5 & -6 & 11. & & \\ -3. & -4 & & & 7. & \\ -2. & & & & & 3. \end{bmatrix} \quad (a)$$

Add .6 of row 1 (above) to row 5, and Add .4 of row 1 to row 6

$$\begin{bmatrix} 5 & & & & -3 & -2 \\ & 9 & & -5 & -4 & \\ & & 6 & -6 & & \\ & -5 & -6 & 11 & & \\ & -4 & & & 5.2 & -1.2 \\ & & & & -1.2 & 2.2 \end{bmatrix} \quad (b)$$

Add $\frac{5}{9}$ of row 2 (above) to row 4, and Add 4/9 of row 2 to row 5

$$\begin{bmatrix} 5 & & & & -3 & -2 \\ & 9 & & -5 & -4 & \\ & & 6 & -6 & & \\ & & -6 & \frac{74}{9} & -\frac{20}{9} & \\ & & & -\frac{20}{9} & \frac{154}{45} & -1.2 \\ & & & & -1.2 & 2.2 \end{bmatrix} \quad (c)$$

Add row 3 (above) to row 4

$$\begin{bmatrix} 5 & & & & -3 & -2 \\ & 9 & & -5 & -4 & \\ & & 6 & -6 & & \\ & & & \frac{20}{9} & -\frac{20}{9} & \\ & & & -\frac{20}{9} & \frac{154}{45} & -1.2 \\ & & & & -1.2 & 2.2 \end{bmatrix} \quad (d)$$

Add row 4 (above) to row 5

$$\begin{bmatrix} 5 & & & & -3 & -2 \\ & 9 & & -5 & -4 & \\ & & 6 & -6 & & \\ & & & 20/9 & -\frac{20}{9} & \\ & & & & 1.2 & -1.2 \\ & & & & -1.2 & 2.2 \end{bmatrix} \quad (e)$$

Add row 5 (above) row 6

$$\begin{bmatrix} 5 & & & & -3 & -2 \\ & 9 & & -5 & -4 & \\ & & 6 & -6 & & \\ & & & \frac{20}{9} & -\frac{20}{9} & \\ & & & & 1.2 & -1.2 \\ & & & & & 1 \end{bmatrix} \quad (f)$$

The matrix in (f) is upper triangular. To make it such that

$$K = U^T D U$$

Then divide each row of (f) by the diagonal term in that row.

$$\therefore U = \begin{bmatrix} 1 & & & & -3/5 & -2/5 \\ & 1 & & -5/9 & -4/9 & \\ & & 1 & -1 & & \\ & & & 1 & -1 & \\ & & & & 1 & -1 \\ & & & & & 1 \end{bmatrix}$$

$$D^{-1} = \begin{bmatrix} 5 & & & & & \\ & 9 & & & & \\ & & 6 & & & \\ & & & 20/9 & & \\ & & & & 6/5 & \\ & & & & & 1 \end{bmatrix}$$

<u>Forward Pass</u>

Solve $\quad U^T D x = P \quad \begin{cases} \text{Solve } U^T z = P \text{ for } z \\ \text{then } \quad D x = z \text{ for } x \quad (x = D^{-1} z) \end{cases}$

$$\begin{bmatrix} 1 & & & & & \\ & 1 & & & & \\ & & 1 & & & \\ & -5/9 & -1 & 1 & & \\ -3/5 & -4/9 & & -1 & 1 & \\ -2/5 & & & & -1 & 1 \end{bmatrix} \begin{bmatrix} z_1 \\ z_2 \\ z_3 \\ z_4 \\ z_5 \\ z_6 \end{bmatrix} = \begin{bmatrix} 5 \\ 3 \\ 1 \\ 2 \\ 4 \\ 6 \end{bmatrix}$$

$z_1 = 5 \qquad , x_1 = d_{11}^{-1} z_1 = (1/5)(5) = 1$

$z_2 = 3 \qquad , x_2 = d_{22}^{-1} z_2 = (1/9)(3) = 1/3$

$z_3 = 1 \qquad , x_3 = d_{33}^{-1} z_3 = (1/6)(1) = 1/6$

$z_4 = 2 + z_3 + 5/9\, z_2 = 2 + 1 + 5/3 = 14/3 \qquad , x_4 = d_{44}^{-1} z_4 = (9/20)(14/3) = \frac{42}{20} = 2.1$

$z_5 = 4 + z_4 + \frac{4}{9} z_2 + \frac{3}{5} z_1 = 4 + \frac{14}{3} + \frac{4}{3} + 3 = 13 \qquad , x_5 = d_{55}^{-1} z_5 = (5/6)(13) = 65/6 = 10\tfrac{5}{6}$

$z_6 = 6 + z_5 + \frac{2}{5} z_1 = 21 \qquad , x_6 = d_{66}^{-1} z_6 = (1)(21) = 21$

Backward Pass

Solve $\quad Uu = y \quad$ for displ'n u

$$\begin{bmatrix} 1 & & & & -3/5 & -2/5 \\ & 1 & & -5/9 & -4/9 & \\ & & 1 & -1 & & \\ & & & 1 & -1 & \\ & & & & 1 & -1 \\ & & & & & 1 \end{bmatrix} \begin{bmatrix} u_1 \\ u_2 \\ u_3 \\ u_4 \\ u_5 \\ u_6 \end{bmatrix} = \begin{bmatrix} 1 \\ 1/3 \\ 1/6 \\ 21/10 \\ 65/6 \\ 21 \end{bmatrix}$$

$$u_6 = 21$$

$$u_5 = 65/6 + u_6 = 31\tfrac{5}{6} = 31.83333$$

$$u_4 = 21/10 + u_5 = 2.1 + 31.83333 = 33.93333$$

$$u_3 = 1/6 + u_4 = .166667 + 33.93333 = 34.1$$

$$u_2 = 1/3 + \tfrac{5}{9} u_4 + \tfrac{4}{9} u_5 = 33.33333$$

$$u_1 = 1 + \tfrac{3}{5} u_5 + \tfrac{2}{5} u_6 = 1 + \tfrac{3}{5}\left(31\tfrac{5}{6}\right) + \tfrac{2}{5}(21) = 28.5$$

$$\begin{bmatrix} u_{101} \\ u_{102} \\ u_{103} \\ u_{104} \\ u_{105} \\ u_{106} \end{bmatrix} = \begin{bmatrix} u_3 \\ u_4 \\ u_2 \\ u_5 \\ u_1 \\ u_6 \end{bmatrix} = \begin{bmatrix} 34.1 \\ 33.933333 \\ 33.333333 \\ 31.833333 \\ 28.5 \\ 21. \end{bmatrix}$$

✓ agrees w/ MYSTRAN

The SPC force at G.P. 107 equilibrates the sum of the applied loads

$$Q_{107} + P_{107} + P_{106} + P_{105} + P_{104} + P_{103} + P_{102} + P_{101} = 0$$

$$Q_{107} = -(7. + 6. + 5. + 4. + 3. + 2. + 1.) = -28.$$ agrees w/ MYSTRAN

The rod loads are

$$\left.\begin{aligned}
P^e_{12} &= P_{101} &&= 1. \\
P^e_{23} &= P_{101} + P_{102} &&= 3. \\
P^e_{34} &= P_{101} + P_{102} + P_{103} &&= 6. \\
P^e_{45} &= P_{101} + P_{102} + P_{103} + P_{104} &&= 10. \\
P^e_{56} &= P_{101} + P_{102} + P_{103} + P_{104} + P_{105} &&= 15. \\
P^e_{67} &= P_{101} + P_{102} + P_{103} + P_{104} + P_{105} + P_{106} &&= 21.
\end{aligned}\right\} \text{tension}$$

Element stresses

$$\sigma_{12} = \frac{P^e_{12}}{A_{12}} = \frac{1.}{.6} = 1.666667 \qquad M.S. = \frac{100}{1.6666} - 1 = 59$$

$$\sigma_{23} = \frac{P^e_{23}}{A_{23}} = \frac{3.}{.5} = 6.0 \qquad M.S. = \frac{100}{6} - 1 = 15.7$$

$$\sigma_{34} = \frac{P^e_{34}}{A_{34}} = \frac{6.}{.4} = 15.0 \qquad M.S. = \frac{100}{15} - 1 = 5.67$$

$$\sigma_{45} = \frac{P^e_{45}}{A_{45}} = \frac{10}{.3} = 33.33333 \qquad M.S. = \frac{100}{33.3333} - 1 = 2$$

$$\sigma_{56} = \frac{P^e_{56}}{A_{56}} = \frac{15.}{.2} = 75.0 \qquad M.S. = \frac{100}{75} - 1 = 0.333$$

$$\sigma_{67} = \frac{P^e_{67}}{A_{67}} = \frac{21}{.1} = 210. \qquad M.S. = \frac{100}{210} - 1 = -.524 \ *$$

*****************************************************************************************************************
Full representation of output matrix C after calculating it using MATADD_FFF:
-------------------------------------------------------------------------------

   322.    212.    113.      0.    330.
     0.    344.    346.    224.      0.
     0.      0.    133.    134.    235.
     0.      0.      0.    244.    390.
     0.      0.      0.      0.    410.

Output matrix C = C        has        5 rows and        5 cols with       13 nonzero terms

Compressed Row Storage (CRS) format of matrix C after calculating it using MATADD_FFF:
-------------------------------------------------------------------------------------

1) Index, L, and array I_C(L) for matrix C, where I_C(L+1) - I_C(L) is the number of nonzero terms in row L of matrix C.
   (also, I_C(L) is the index, K, in array C(K) where row L begins - up to, but not including, the last entry in I_C(L)).

   L, I_C(L)       =            1           1
   L, I_C(L)       =            2           5
   L, I_C(L)       =            3           8
   L, I_C(L)       =            4          11
   L, I_C(L)       =            5          13
   L, I_C(L)       =            6          14
```

2) Index, K, and arrays J_C(K) and C(K). C(K) are the nonzeros in matrix C and J_C(K) is the col number in matrix C for term C(K).

K, J_C(K), C(K) =	1	1	3.220000E+02

		13	3	31455
		14	4	39370

NOTE: B must be stored in CCS sparse format for the matrix mult. routines (sparse ones), i.e., when A and/or C is sparse

This will be the result for C in {MATMULT_SFS.OUTb,c / MATMULT_SSS.OUTb,c and MATMULT_SSS.OUTb,c will have C in full format as shown above in A·B=C

Check on Sparse Matrix Partitioning routine

Example Problems Used To Checkout Matrix Partition Routines: PARTITION_SIZE, PARTITION

Example IN1-1: (All partitions are done with partitioning vectors = 1 (not 2))

$$MATIN = \begin{bmatrix} 11. & 12. & 13. & 14. & 15. \\ 12. & 22. & 23. & 24. & 25. \\ 13. & 23. & 33. & 34. & 35. \\ 14. & 24. & 34. & 44. & 45. \\ 15. & 25. & 35. & 45. & 55 \end{bmatrix}$$

terms in red are not explicitly input since MATIN, in this example, is stored symmetrically (SYM_IN = 'Y')

Run 1-YN (SYM_OUT = 'N')

row part vec: 1 1 1 2 2
col part vec: 1 1 1 2 2

$$MATOUT = \begin{bmatrix} 11. & 12. & 13. \\ 12. & 22. & 23. \\ 13. & 23. & 33. \end{bmatrix}$$

Run 1-YY (SYM_OUT = 'Y')

row_part_vec = 1 1 1 2 2
col_part_vec = 1 1 1 2 2

$$MATOUT = \begin{bmatrix} 11. & 12. & 13. \\ 12. & 22. & 23. \\ 13. & 23. & 33. \end{bmatrix}$$

terms in red not stored (SYM_OUT = 'Y')

Run 2-YN (SYM_OUT = 'N')

row part vec: 2 2 2 1 2
col part vec: 2 2 2 2 1

MATOUT = [45.]

Run 2-YY (SYM_OUT = 'Y')

row part vec = 2 2 2 1 2
col part vec = 2 2 2 2 1

MATOUT = [45.]

Run 3-YN (SYM_OUT = 'N')

row part vec: 2 2 2 2 1
col part vec: 2 2 2 1 2

MATOUT = [45.]

Run 3-YY (SYM_OUT = 'Y')

row part vec = 2 2 2 2 1
col part vec = 2 2 2 1 2

MATOUT is null since we are asking for term 5,4 (which is 45. value) and we want SYM_OUT = 'Y' (no sub diagonals explicit)

Run 4-YN (SYM_OUT = 'N')

row part vec: 2 2 2 1 1
col part vec: 2 2 2 1 1

$$MATOUT = \begin{bmatrix} 44. & 45. \\ 45. & 55. \end{bmatrix}$$

Run 4-YY (SYM_OUT = 'Y')

row part vec = 2 2 2 1 1
col part vec = 2 2 2 1 1

$$MATOUT = \begin{bmatrix} 44. & 45. \\ 45. & 55. \end{bmatrix}$$

Run 5-YN (SYM_OUT = 'N')

row part vec = 2 2 2 1 1
col part vec = 1 1 1 2 2

$$MATOUT = \begin{bmatrix} 14. & 24. & 34. \\ 15. & 25. & 35. \end{bmatrix}$$

Run 5-YY (SYM_OUT = 'Y')

row part vec = 2 2 2 1 1
col part vec = 1 1 1 2 2

ERROR 909 SYM_OUT = 'Y' but MATOUT not square

Also MATOUT is null since we ask for SYM_OUT = 'Y' and the terms that would be partitioned are below the diagonal in MATIN

Run 6-YN (SYM_OUT = 'N')

row part vec = 1 1 2 2 2
col part vec = 2 2 1 1 1

$$MATOUT = \begin{bmatrix} 13. & 14. & 15. \\ 23. & 24. & 25. \end{bmatrix}$$

Run 6-YY (SYM_OUT = 'Y')

row part vec = 1 1 2 2 2
col part vec = 2 2 1 1 1

*Error 909: Asked for SYM_OUT = 'Y' but rows and cols to be partitioned do not form a symmetric matrix

xample IN1-2

$$MATIN = \begin{bmatrix} 11. & 12. & 13. & 14. & 15. & 16. & 17. \\ 21. & 22. & 23. & 24. & 25. & 26. & 27. \\ 31. & 32. & 33. & 34. & 35. & 36. & 37. \\ 41. & 42. & 43. & 44. & 45. & 46. & 47. \end{bmatrix} \qquad SYM_IN = 'N'$$

PROGRAM DRIVE_MATTRNSP_SS:
 -------------------------

 Driver for sparse matrix transposition subr (MATTRNSP_SS.FOR) checkout: B = A(transpose) where input A and result B are in sparse
 Compressed Row Storage (CRS) format

 ____________________________________________________________________________________________________________________________________

 ::::::::::::::::::::::::::::::::::::::START DEBUG(85) OUTPUT FROM SUBROUTINE MATTRNSP_SS::::::::::::::::::::::::::::::::::::::::

 SSS SPARSE MATRIX TRANSPOSITION ROUTINE: Transpose matrix A, stored in sparse Compressed Row Storage (CRS) format, to matrix AT,
 ----------------------------------------
 stored in sparse CRS format also

                                        The name of CRS formatted matrix A is: A
                                        The name of CRS formatted matrix B is: AT
                                        The name of CRS formatted matrix C is:
                           Matrix A  has        6 rows and        5 cols and           16 nonzero terms

 ****************************************************************************************************************************************
 Input matrix A = A        has        6 rows and        5 cols with       16 nonzero terms

 Compressed Row Storage (CRS) format of matrix A:
 ------------------------------------------------

 1) Index, L, and array I_A(L) for matrix A, where I_A(L+1) - I_A(L) is the number of nonzero terms in row L of matrix A.
    (also, I_A(L) is the index, K, in array A(K) where row L begins - up to, but not including, the last entry in I_A(L)).
```

```
L, I_A(L)       =            1           1
L, I_A(L)       =            2           4
L, I_A(L)       =            3           7
L, I_A(L)       =            4           7
L, I_A(L)       =            5          12
L, I_A(L)       =            6          13
L, I_A(L)       =            7          17
```

2) Index, K, and arrays J_A(K) and A(K). A(K) are the nonzeros in matrix A and J_A(K) is the col number in matrix A for term A(K).

```
K, J_A(K), A(K) =            1           1   1.100000E+01
K, J_A(K), A(K) =            2           3   1.300000E+01
K, J_A(K), A(K) =            3           5   1.500000E+01
K, J_A(K), A(K) =            4           2   2.200000E+01
K, J_A(K), A(K) =            5           4   2.400000E+01
K, J_A(K), A(K) =            6           5   2.500000E+01
K, J_A(K), A(K) =            7           1   4.100000E+01
K, J_A(K), A(K) =            8           2   4.200000E+01
K, J_A(K), A(K) =            9           3   4.300000E+01
K, J_A(K), A(K) =           10           4   4.400000E+01
K, J_A(K), A(K) =           11           5   4.500000E+01
K, J_A(K), A(K) =           12           5   5.500000E+01
K, J_A(K), A(K) =           13           1   6.100000E+01
K, J_A(K), A(K) =           14           2   6.200000E+01
K, J_A(K), A(K) =           15           3   6.300000E+01
K, J_A(K), A(K) =           16           4   6.400000E+01
```

****

Output matrix AT = AT has 5 rows and 6 cols with 16 nonzero terms

Compressed Row Storage (CRS) format of matrix AT after calculating it using MATMULT_FFF:

---

1) Index, L, and array I_AT(L) for matrix AT, where I_AT(L+1) - I_AT(L) is the number of nonzero terms in row L of matrix AT.

(also, I_AT(L) is the index, K, in array AT(K) where row L begins - up to, but not including, the last entry in I_AT(L)).

```
L, I_C(L)       =            1           1
L, I_C(L)       =            2           4
L, I_C(L)       =            3           7
L, I_C(L)       =            4          10
L, I_C(L)       =            5          13
L, I_C(L)       =            6          17
```

2) Index, K, and arrays J_AT(K) and AT(K). AT(K) are the nonzeros in matrix AT and J_AT(K) is the col number in matrix AT for term AT(K).

```
K, J_AT(K), AT(K) =            1           1   1.100000E+01
K, J_AT(K), AT(K) =            2           4   4.100000E+01
K, J_AT(K), AT(K) =            3           6   6.100000E+01
K, J_AT(K), AT(K) =            4           2   2.200000E+01
K, J_AT(K), AT(K) =            5           4   4.200000E+01
K, J_AT(K), AT(K) =            6           6   6.200000E+01
K, J_AT(K), AT(K) =            7           1   1.300000E+01
K, J_AT(K), AT(K) =            8           4   4.300000E+01
K, J_AT(K), AT(K) =            9           6   6.300000E+01
K, J_AT(K), AT(K) =           10           2   2.400000E+01
